Nutritive Value of Foods

[Blank Page in Original Bulletin]

A table of nutritive values for household measures of commonly used foods makes up the greater part of this bulletin. First published in 1960 by the United States Department of Agriculture, the bulletin was revised in 1964, 1970, 1971, 1977, and 1978. In this revision, which has been adapted with permission, values for breakfast cereals have been updated. Recent information is provided on the dairy products group; on the enrichment levels of white bread and rolls, white flour, self-rising flour, and products prepared with these enriched flours; and on the fatty acid content of the foods.

[Blank Page in Original Bulletin]

NUTRITIVE VALUE OF FOODS

Extension Foods and Nutrition Specialists
The Texas A&M University System

A glass of milk... a slice of cooked meat... an apple... a slice of bread... What food values does each contain? How much cooked meat will a pound of raw meat yield?

How much daily protein is recommended for a healthy 14-year-old boy?

Ready answers to questions like those are helpful to homemakers who need the information to plan nutritionally adequate diets and to nutritionists, dietitians, physicians, and other consumers.

The answers will be found in the tables in this publication.

EXPLANATION OF THE TABLES

Some helpful volume and weight equivalents are shown in table 1.

Table 1.—Equivalents by Volume and Weight

Volume	
Level measure	Equivalent
1 gallon (3.786 liters; 3,786 milliliters)	4 quarts
1 quart (0.946 liter; 946 milliliters)	4 cups
1 cup (237 milliliters)	8 fluid ounces ½ pint 16 tablespoons
2 tablespoons (30 milliliters)	1 fluid ounce
1 tablespoon (15 milliliters)	3 teaspoons
1 pound regular butter or margarine	4 sticks 2 cups
1 pound whipped butter or margarine	6 sticks Two 8-ounce containers 3 cups

Weight

Avoirdupois weight	Equivalent
1 pound (16 ounces)	453.6 grams
1 ounce	28.35 grams
3½ ounces	100 grams

Nutritive Value of Foods (Table 2)

Table 2 shows the food values in 730 foods commonly used.

Foods listed.—Foods are grouped under the following main headings:

Dairy products

Eggs

Fats and oils

Fish, shellfish, meat, and poultry

Fruits and fruit products

Grain products

Legumes (dry), nuts, and seeds

Sugars and sweets

Vegetables and vegetable products

Miscellaneous items

Most of the foods listed are in ready-to-eat form. Some are basic products widely used in food preparation, such as flour, fat, and cornmeal.

The weight in grams for an approximate measure of each food is shown. A footnote indicates if inedible parts are included in the description and the weight. For example, item 246 is half a grapefruit with peel having a weight of 241 grams. A footnote to this item explains that the 241 grams include the weight of the peel.

The approximate measure shown for each food is in cups, ounces, pounds, some other well-known unit, or a piece of certain size. The cup measure refers to the standard measuring cup of 8 fluid ounces or one-half liquid pint. The ounce refers to one-sixteenth of a pound avoirdupois, unless fluid ounce is indicated. The weight of a fluid ounce varies according to the food measured.

Food values.—Table 2 also shows values for protein, fat, total saturated fatty acids, two unsaturated fatty acids (oleic acid and linoleic acid), total carbohydrates, four minerals (calcium, iron, phosphorus, and potassium), and five vitamins (vitamin A; thiamin, riboflavin, niacin, and ascorbic acid or vitamin C). Food energy is in calories. The calorie is the unit of measurement for the energy furnished the body by protein, fat, and carbohydrate.

Those values can be used to compare kinds and amounts of nutrients in different foods. They sometimes can be used to compare different forms of the same food.

Water content is included because the percentage of moisture present is needed for identification and comparison of many food items.

The values for food energy (calories) and nutrients shown in table 2 are the amounts present in the edible part of the item, that is, in only that portion customarily eaten—corn without cob, meat without bone, potatoes without skin, European-type grapes without seeds. If additional parts are eaten—the potato skin, for example—amounts of some nutrients obtained will be somewhat greater than those shown.

Values for thiamin, riboflavin, and niacin in white flours and white bread and rolls are based on the increased enrichment levels put into effect for those products by the Food and Drug Administration in 1974. Iron values for those products and the values for enriched cornmeals, pastas, farina, and rice (except riboflavin) represent the minimum levels of enrichment promulgated under the Federal Food, Drug, and Cosmetic Act of 1955. Riboflavin values of rice are for unenriched rice, as the levels for added riboflavin have not been approved. Thiamin, riboflavin, and niacin values for products prepared with white flours represent the use of flours enriched at the 1974 levels and iron at the 1955 levels. Enriched flour is predominately used in home-prepared and commercially prepared baked goods.

Fatty acid values are given for dairy products, eggs, meats, some grain products, nuts, and soups. The values are based on comprehensive research by USDA to update and extend tables for fatty acid content for foods.

Niacin values are for preformed niacin occurring naturally in foods. The values do not include additional niacin that the body may form from tryptophan, an essential amino acid in the protein of most foods. Among the better sources of tryptophan are milk, meats, eggs, legumes, and nuts.

Values have been calculated from the ingredients in typical recipes for many of the prepared items such as biscuits, corn muffins, macaroni and cheese, custard, and many dessert-type items.

Values for toast and cooked vegetables are without fat added, either during preparation or at the table. Some destruction of vitamins, especially ascorbic acid, may occur when vegetables are cut or shredded. Since such losses are variable, no deduction has been made.

For meat, values are for meat cooked and drained of the drippings. For many cuts, two sets of values are shown: meat including fat and meat from which the fat has been removed either in the kitchen or on the plate.

A variety of manufactured items—some of the milk products, ready-to-eat breakfast cereals, imitation cream products, fruit drinks, and various mixes—are included in table 2. Frequently those foods are fortified with one or more nutrients. If nutrients are added, this information is

on the label. Values shown here for those foods are usually based on products from several manufacturers and may differ somewhat from the values provided by any one source.

Yield of Cooked Meat (Table 3)

Meat undergoes certain losses from the time it is purchased to the time it is served. Among these losses are those from evaporation of moisture, loss of fat in the drippings, and removal of bone and various trimmings.

Table 3 shows, for several retail cuts, the yield of cooked meat from 1 pound of raw meat. Yield is given as ounces of

Cooked meat with bone and fat

Cooked lean and fat

Cooked lean only.

Among the factors influencing the yield of meat is the proportion of fat and lean in the piece. Many cuts have a layer of fat extending all or part way around. The thickness of this fat varies because cutting and trimming practices for retail distribution differ widely. The information on yield in table 3 and on nutritive value in table 2 applies to retail cuts trimmed according to typical market practices. Deposits of fat within a cut may be extensive and usually are not affected by retail trimming but may be discarded at the table.

Recommended Daily Dietary Allowances (Table 4)

Table 4 shows Recommended Daily Dietary Allowances (RDA) for calories and for several nutrients essential for maintenance of good nutrition in healthy, normally active persons. This table is an abbreviated version adapted from more extensive material published by the Food and Nutrition Board, National Academy of Sciences—National Research Council in 1980.

Additional nutrients for which the Food and Nutrition Board published RDA are the B-vitamins (vitamins B₆ and B₁₂ and folacin), vitamins D and E, magnesium, iodine, and zinc.

Data for these nutrients are not shown in tables 2 or 4. However, table 5 lists foods that are of special value in supplying these eight nutrients (either because they are high in the nutrient or because quantities generally eaten supply relatively large amounts).

Recommended iron allowances for infants, children 1 to 3 years old, and females of childbearing age are almost impossible to obtain through ordinary foods. Choosing foods rich in iron—lean meats, shellfish, liver, heart, kidney, dry beans and peas, dark-green vegetables, dried fruit, cereals with added iron, and molasses—can help to meet iron allowances.

More detailed information about RDA may be obtained from the publication from which table 4 is adapted.

FURTHER INFORMATION

A number of other publications of the Science and Education Administration, U.S. Department of Agriculture, give helpful information about nutrients and in which foods they are found.

Agriculture Handbook No. 8, "Composition of Foods...Raw, Processed, Prepared," is a more technical publication with data for a much more extensive list of foods. In it data are presented for the nutrients in 100 grams of edible portion and 1 pound of food as purchased. Nutrients in household measures and market units for many foods are in Agriculture Handbook No. 456, "Nutritive Value of American Foods in Common Units."

Information about nutrition labeling and the percent of the U.S. RDA of eight nutrients furnished by several household measures of foods may be found in Agriculture Information Bulletin No. 382, "Nutrition Labeling—Tools for Its Use."

These publications may be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, or any U.S. Government Printing Office bookstore.

³Applies to product without vitamin A added.

⁴Applies to product with added vitamin A. Without added vitamin A, value is 20 International Units (I.U.).

⁵Yields 1 qt of fluid milk when reconstituted according to package directions.

⁶Applies to product with added vitamin A.

⁷Weight applies to product with label claim of 1 1/3 cups equal 3.2 oz.

⁸Applies to products made from thick shake mixes and that do not contain added ice cream. Products made from milk shake mixes are higher in fat and usually contain added ice cream.

⁹Content of fat, vitamin A, and carbohydrate varies. Consult the label when precise values are needed for special diets.

¹⁰Applies to product made with milk containing no added vitamin A.

¹¹Based on year-round average.

TABLE 2.—NUTRITIVE VALUES OF THE EDIBLE PART OF FOODS - Continued

¹² Based on average vitamin A content of fortified margarine. Federal specifications for fortified margarine require a minimum of 15,000 International Units (I.U.) of vitamin A per pound.

¹³ Fatty acid values apply to product made with regular-type margarine.

¹⁴ Dipped in egg, milk or water, and breadcrumbs; fried in vegetable shortening.

¹⁵ If bones are discarded, value for calcium will be greatly reduced.

¹⁶ Dipped in egg, breadcrumbs, and flour or batter.

¹⁷ Prepared with tuna, celery, salad dressing (mayonnaise type), pickle, onion, and egg.

¹⁸ Outer layer of fat on the cut was removed to within approximately 1/2 in of the lean. Deposits of fat within the cut were not removed.

¹⁹Crust made with vegetable shortening and enriched flour.

²⁴Also applies to pasteurized apple cider.

²⁵Applies to product without added ascorbic acid. For value of product with added ascorbic acid, refer to label.

²⁶Based on product with label claim of 45% of U.S. RDA in 6 fl oz.

²⁷Based on product with label claim of 100% of U.S. RDA in 6 fl oz.

²⁸Weight includes peel and membranes between sections. Without these parts, the weight of the edible portion is 123 g for item 246 and 118 g for item 247.

²⁹For white-fleshed varieties, value is about 20 International Units (I.U.) per cup; for red-fleshed varieties, 1,080 I.U.

³⁰Weight includes seeds. Without seeds, weight of the edible portion is 57 g.

³¹Applies to product without added ascorbic acid. With added ascorbic acid, based on claim that 6 fl oz of reconstituted juice contain 45% or 50% of the U.S. RDA, value in milligrams is 108 or 120 for a 6-fl oz can (item 258), 36 or 40 for 1 cup of diluted juice (item 259).

³²For products with added thiamin and riboflavin but without added ascorbic acid, values in milligrams would be 0.60 for thiamin, 0.80 for riboflavin, and trace for ascorbic acid. For products with only ascorbic acid added, value varies with the brand. Consult the label.

²⁷Based on product with label claim of 100% of U.S. RDA in 6 fl oz.

³³Weight includes rind. Without rind, the weight of the edible portion is 272 g for item 271 and 149 g for item 272.

³⁴Represents yellow-fleshed varieties. For white-fleshed varieties, value is 50 International Units (I.J.) for 1 peach, 90 I.U. for 1 cup of slices.

³⁵Value represents products with added ascorbic acid. For products without added ascorbic acid, value in milligrams is 116 for a 10-oz container, 103 for 1 cup.

³⁶Weight includes pits. After removal of the pits, the weight of the edible portion is 258 g for item 302, 133 g for item 303, 43 g for item 304, and 213 g for item 305.

³⁷Weight includes rind and seeds. Without rind and seeds, weight of the edible portion is 426 g.

³⁸Made with vegetable shortening.

³⁹Applies to product made with white cornmeal. With yellow cornmeal, value is 30 International Units (I.U.).

⁴⁰Applies to white varieties. For yellow varieties, value is 150 International Units (I.U.).

⁴¹Applies to products that do not contain di-sodium phosphate. If di-sodium phosphate is an ingredient, value is 162 mg.

⁴²Value may range from less than 1 mg to about 8 mg depending on the brand. Consult the label.

⁴³Applies to product with added nutrient. Without added nutrient, value is trace.

⁴⁴Value varies with the brand. Consult the label.

TABLE 2.—NUTRITIVE VALUES OF THE EDIBLE PART OF FOODS - Continued

⁴⁴Value varies with the brand. Consult the label.⁴⁵Applies to product with added nutrient. Without added nutrient, value is trace.⁴⁶Excepting angelfood cake, cakes were made from mixes containing vegetable shortening; icings, with butter.⁴⁷Excepting spongecake, vegetable shortening used for cake portion; butter, for icing. If butter or margarine used for cake portion, vitamin A values would be higher.⁴⁸Applies to product made with a sodium aluminum-sulfate type baking powder. With a low-sodium type baking powder containing potassium, value would be about twice the amount shown.⁴⁹Equal weights of flour, sugar, eggs, and vegetable shortening.⁵⁰Products are commercial unless otherwise specified.⁵¹Made with enriched flour and vegetable shortening except for macaroons which do not contain flour or shortening.⁵²Icing made with butter.

⁶⁶Weight includes cores and stem ends. Without these parts, weight is 123 g.

⁶⁷Based on year-round average. For tomatoes marketed from November through May, value is about 12 mg; from June through October, 32 mg.

⁶⁸Applies to product without calcium salts added. Value for products with calcium salts added may be as much as 63 mg for whole tomatoes, 241 mg for cut forms.

⁶⁹Weight includes pits. Without pits, weight is 13 g for item 701, 9 g for item 702.

Table 3.—Yield of cooked meat per pound of raw meat as purchased

Retail cut and method of cooking	Yield after cooking (less drippings)		
	Parts weighed		Weight
Chops or steaks for broiling or frying:			Ounces
With bone and relatively large amount of fat, such as pork or lamb chops; beef rib, sirloin, or porterhouse steaks.	Lean, bone, fat	10-12	
Without bone and with very little fat, such as round of beef, veal steaks.	Lean and fat	7-10	
Ground meat for broiling or frying, such as beef, lamb, or pork patties.	Lean only	5-7	
	Lean and fat	12-13	
	Lean only	9-12	
	Patties	9-13	
Roast for oven cooking (no liquid added):			
With bone and relatively large amount of fat, such as beef rib, loin, chuck; lamb shoulder, leg; pork, fresh or cured.	Lean, bone, fat	10-12	
Without bone	Lean and fat	8-10	
	Lean only	6-9	
	Lean and fat	10-12	
	Lean only	7-10	
Cuts for pot roasting, simmering, braising, stewing:			
With bone and relatively large amount of fat, such as beef chuck, pork shoulder.	Lean, bone, fat	10-11	
Without bone and with relatively small amount of fat, such as trimmed beef, veal.	Lean and fat	8-9	
	Lean only	6-8	
	Lean with adhering fat	9-11	

(applicable for the preparation of those cuts of meat which are usually prepared without the addition of liquid)

TABLE 4.—RECOMMENDED DAILY DIETARY VITAMIN REQUIREMENTS (RDA)

TABLE 4.—RECOMMENDED DAILY DIETARY ALLOWANCES (RDA)¹

(Designed for the maintenance of good nutrition of practically all healthy persons in the United States.)

¹Source: Adapted from Recommended Dietary Allowances, 9th ed., 1980, 185 pp. Washington, D.C. 20418. National Academy of Sciences—National Research Council. Also available in libraries. This publication tabulates the RDA for selected nutrients, discusses the basic for all the RDA, and reviews current knowledge of the dietary needs for other nutrients.

²After age 75 years, energy requirement is 2,050 calories for males and 1,600 calories for females.

³The increased requirement cannot be met by ordinary diets; therefore, the use of supplemental iron is recommended.

NOTE.—The Recommended Daily Dietary Allowances (RDA) should not be confused with the U.S. Recommended Daily Allowances (U.S. RDA). The RDA are amounts of nutrients recommended by the Food and Nutrition Board of the National Research Council and are considered adequate for maintenance of good nutrition in healthy persons in the United States. The allowances are revised from time to time in accordance with newer knowledge of nutritional needs.

The U.S. RDA are the amounts of proteins, vitamins, and minerals established by the Food and Drug Administration as standards for nutrition labeling. These allowances were derived from the RDA set by the Food and Nutrition Board. The U.S. RDA for most nutrients approximates the highest RDA of the sex-age categories in this table, excluding the allowances for pregnant and lactating females. Therefore, a diet that furnishes the U.S. RDA for a nutrient will furnish the RDA for most people and more than the RDA for many. U.S. RDA are protein, 45 grams (eggs, fish, meat, milk, poultry), 65 grams (other foods); vitamin A, 5,000 International Units; thiamin, 1.5 milligrams; riboflavin, 1.7 milligrams; niacin, 20 milligrams; ascorbic acid, 60 milligrams; calcium, 1 gram; phosphorus, 1 gram; iron, 18 milligrams. For additional information on U.S. RDA, see the "Federal Register," vol. 38, no. 49 (March 14, 1973), pp. 6959-6960, and Agriculture Information Bulletin 382, "Nutritional Labeling—Tools for Its Use."

Table 5.—Food sources of additional nutrients

<i>Vitamins</i>		
<u>Vitamin B₆</u>	<u>Vitamin B₁₂</u>	<u>Vitamin E</u>
Bananas	(present in foods of animal origin only)	Vegetable oils
Whole-grain cereals	Kidney	Margarine
Chicken	Liver	Whole-grain cereals
Dry legumes	Meat	Peanuts
Most dark-green leafy vegetables	Milk	
Most fish and shellfish	Most cheese	<u>Folacin</u>
Muscle meats, liver and kidney	Most fish	Liver
Peanuts, walnuts, filberts, and peanut butter	Shellfish	Dark-green vegetables
Potatoes and sweetpotatoes	Whole egg and egg yolk	Dry beans
Prunes and raisins		Peanuts
Yeast		Wheat germ
<u>Vitamin D</u>		
	Vitamin D milks	
	Egg yolk	
	Saltwater fish	
	Liver	
<i>Minerals</i>		
<u>Iodine</u>	<u>Magnesium</u>	<u>Zinc</u>
Iodized salt	Bananas	Shellfish
Seafood	Whole-grain cereals	Meat
	Dry beans	Poultry
	Milk	Cheese
	Most dark-green vegetables	Whole-grain cereals
	Nuts	Dry beans
	Peanuts and peanut butter	Cocoa
		Nuts
