TEXAS AGRICULTURAL EXPERIMENT STATION

R. D. LEWIS, DIRECTOR, COLLEGE STATION, TEXAS

IMPROVEMENT OF SHEEP THROUGH THE SELECTION OF
PERFORMANCE TESTED AND PROGENY TESTED
BREEDING ANIMALS, 1958-59

The results of the eleventh annual ram test are given herein. Ram performance and progeny tests have been held at this Station each year since 1948 in cooperation with sheep breeders and the U. S. Department of Agriculture.

During this period of time approximately 1400 rams representing 6 breeds and numerous crossbred strains have been tested. Two lines representing at least 5 generations have been tested.

The eleventh test began officially on October 1, 1958 with 125 rams at the Station and 9 on cooperative pasture test at Junction. The rams were "warmed up" on alfalfa hay and oats for 10-14 days prior to the starting date. All were initially sheared on September 24, including those on pasture test. Ninety-four rams were fed in 24 sire groups and 31 were fed together in a large lot. Of the total of 134 rams on test 95 were registered Rambouilletts. The others were commercial rams.

Only one ram was lost during the course of the test. That was Test No. 133, which was on pasture at Junction. Test No. 88 died the night following the final shearing on March 19, presumably of an injury.

The gain test lasted 168 days - 6 28-day periods. Fleece growth was measured for a 175-day period between shearings on September 24, 1958 and March 19, 1959.

The Texas Agricultural Experiment Station Wool Research Laboratory furnished scouring results and fiber diameter measurements. Each entire fleece was scoured separately and results were reported with moisture content standardized to 12 percent. Fiber diameter determinations were made with a micronaire according to standard procedures.

This year's ration consisted of equal parts of alfalfa hay and oats, hand fed according to appetite. Feed trials were conducted separately to determine the feasibility of returning to a self-fed type ration in future tests.

Staple length, grease fleece weights and clean fleece weights were reported on a 365-day basis. No stubble was removed from the measured staple lengths; therefore about .25 inch of the staple length reported herein can be attributed to shearing stubble and is not in actuality wool produced during the 365-day period.

As in past tests, a committee scoring system was used to determine face covering, belly covering and body conformation. The following scores were used:

Face Covering: Open (1); Medium Covered (2); Covered (3); Wool Blind (4).

Belly Covering: Dense (1); Medium (2); Poor (3); Bare (4).

Body Conformation: Excellent (1); Good (2); Fair (3); Poor (4).

Skin folds are counted and scored as to size. The higher the score the greater the skin fold development.

Initial and final body weights were determined by weighing the rams on two consecutive days and averaging the two weights. This system reduced weight errors due to excessive or subnormal fills.

AVERAGE VALUES FOR RAMBOUILLET

Year	Daily Gain Lb.	Grease Wool, Lb.	Clean Wool Lb.	Staple Length, Inches	Face Covering Score	Skin Fold Count
1948-49	.37	13.8	6.6	3.36	2.7	33.8
1949-50	.45	16.7	7.8	3.57	2.8	38.9
1950-51	.49	18.0	8.1	3.34	2.7	44.8
1951-52	.46	17.7	8.2	3.47	3.3	25.1
1952-53	.48	18.4	8.6	3.56	3.0	40.7
1953-54	.51	19.5	9.3	3.80	2.9	31.3
1954-55	.49	17.8	8.7	4.07	2.8	32.2
1955-56	.48	19.9	9.2	3.87	2.7	26.6
1956-57	.50	18.8	9.1	4.02	2.8	25.7
1957-58	.60	19.2	9.3	4.20	2.6	36.4
1958-59	.49	15.4	8.0	4.16	3.0	26.3

Values for feed conversion and clean fleece weights have been adjusted for initial body weight. Due to the great variation in initial body size (60 to 141 pounds), these figures were adjusted by use of a regression coefficient in order that sire groups of older lambs could be compared to sire groups of younger animals.

Selection index values have been calculated for each registered Rambouillet ram. Since the index formula was developed from data involving this breed, it is not known whether or not it is applicable to commercial breeding. Therefore, index values for commercial rams are not shown in the report. The formula used was developed by Dr. J. M. Shelton from Sonora data and is calculated as follows:

Selection Index = $60 X$ (daily gain in pounds) - $5.2 X$ (face cover score) - $0.2 X$ (skin fold count) + $6.0 X$ (staple length in inches) + 4.0 (adjusted clean wool in pounds).

Index scores for the highest ranking 25 rams are shown at the conclusion of this report.

Clean fleece weights on this test were lower than for many years. This is due primarily to the small size of the rams at the test completion. The rams averaged only 170 pounds at the end of the test, compared to an average of 202 pounds during the past 6 years. This light weight may be attributed to the low initial weight of the rams (88 pounds compared to 94 for the past 6 years) and to the shorter feeding period (168 days compared to 224). The rams at the completion of the test lacked a mature size and did not have sufficient body surface to produce the quantity of wool which can be produced by rams 30 pounds heavier.

A separate report is included in this bulletin which gives the results of a comparison of feedlot and range testing.

Acknowledgement is made of the fine cooperation of the following persons who assisted in scoring the rams for body conformation, face covering, belly covering and taking staple measurements and fleece samples: J. E. "Spud" Tatum, Vocational Agriculture Instructor, Rocksprings; Hayden Haby, County Agent, Rocksprings; Clinton Langford, County Agent, Sonora; John Williams, Eldorado; Richard Jones, Eldorado; Leo Richardson, Iraan; Rod Richardson, Iraan; Vernon Jones, County Agent, Junction; and Aubrey Kothmann, Junction.

Note: Commercial rams, Test Nos. 100, 104 and 98, would have been on this list had their scores been included in the report.

PASTURE-FEEDLOT COMPARISON

On September 16, 1958 eighteen rams belonging to Aubrey Kothmann, Junction, were paired as closely as possible for body weight, staple length and density. One of each pair was placed in one of two groups. One group of 9 rams was left on pasture on the Kothmann ranch, while the other group was taken to the Sonora Station for feedlot testing.

Average body weight, staple length, fiber diameter and grease fleece weight at the start of the test are shown in the following table:

	No. of Rams	Body Weight 9/15/59	Staple Length 9/15/59	Grease Fl. Wt. 9/24/59	Fiber Diam. (Micr.)
Pasture Group	9	106.8	2.78	6.58	20.48
Feedlot Group	9	107.9	2.79	6.24	19.32

The Station group was handled in a similar manner to others on the test. Their pairs on pasture test were not fed other than a small amount of mineral supplement containing some protein. This supplement has been used for several years on this ranch and is considered a normal ranch operation.

At the conclusion of the test, performance of the two groups was compared. Average values for the two groups are given in the following table:

	Pasture Group	Feedlot Group
Body weight	136	157
Average daily gain	.24	.39
Grease fleece weight	13.85	15.43
Clean fleece weight	6.55	6.93
Staple length	4.23	4.22
Fiber diameter	20.6 (64s)	19.8 (70s)
Conformation	2.3	2.2
Belly covering	3.0	2.3
Skin folds	16.1	13.4
Face covering	1.5	2.4
Fleece shrinkage (percent)	53	55

As noted, by testing under feedlot conditions gains were increased by 0.15 pound per day. Consequently, the final weight of the rams in the feedlot was 21 pounds heavier than those on pasture. Grease wool and clean wool weights were heavier from the feedlot rams, probably due to their greater size.

It is interesting to note that staple length, fiber diameter and skin folds were not significantly affected by this level of feeding. The lack of differences may be due in part to the good condition of pastures on the Kothmann ranch.

There appeared to be considerably less wool on the faces and bellies of the pasture rams compared to those in the feedlot. While it is not certain, there is a possibility that grazing in and around brush may be responsible for the differences in covering.

Acknowledgement

This study was made possible with the help of Extension Service personnel with whom Aubrey Kothmann has been working for several years. Particularly Vernon Jones, Kimble County Agent, was of great help in the planning and carrying out of this work.
