ENERGY SYSTEMS LABORATORY

Texas Engineering Experiment Station
Texas A&M University System
December 10, 2007

Chairman H. S. Buddy Garcia
Texas Council on Environmental Quality
P. O. Box 13087
Austin, TX 78711-3087

Dear Chairman Garcia:

The Energy Systems Laboratory (Laboratory) at the Texas Engineering Experiment Station of the Texas A&M University System is pleased to provide its fifth annual report, "Energy Efficiency/Renewable Energy Impact in the Texas Emissions Reduction Plan (TERP)," as required under Texas Health and Safety Code Ann. § 388.003 (c), Vernon Supp. 2002 (Senate Bill 5, 77R as amended 78 R & 78S).

The Laboratory is required to annually report the energy savings from statewide adoption of the Texas Building Energy Performance Standards in Senate Bill 5 (SB 5), as amended, and the relative impact of proposed local energy code amendments in the Texas non-attainment and near-non-attainment counties as part of the Texas Emissions Reduction Plan (TERP).

Please contact me at (979) 862-1280 should you or any of the TCEQ staff have any questions concerning this report or any of the work presently being done to quantify emissions reduction from energy efficiency and renewable energy measures as a result of the TERP implementation.

Sincerely,

David E. Claridge, Ph.D., P.E.
Director

Enclosure

cc: Commissioner Larry R. Soward
Commissioner Bryan Shaw
Executive Director Glenn Shankle
Disclaimer

This report is provided by the Texas Engineering Experiment Station (TEES) as required under Section 388.003 (e) of the Texas Health and Safety Code and is distributed for purposes of public information. The information provided in this report is intended to be the best available information at the time of publication. TEES makes no claim or warranty, express or implied, that the report or data herein is necessarily complete. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not constitute or imply its endorsement, recommendation, or favoring by the Energy Systems Laboratory or any of its employees. The views and opinions of authors expressed herein do not necessarily state or reflect those of the Texas Engineering Experiment Station or the Energy Systems Laboratory.

August 2017
Energy Systems Laboratory, Texas A&M University System
EXECUTIVE SUMMARY

The report is organized in three volumes:
Volume I - Summary Report - provides an executive summary and overview.
Volume II - Technical Report - provides a detailed report of activities, methodologies and findings.
Volume III - Technical Appendix - contains detailed data from simulations for each of the counties included in the analysis.

Accomplishments:

1. Energy Code Amendments

The Laboratory was requested by several municipalities to analyze the stringency of several proposed residential and commercial energy code amendments, including: the 2001 and 2006 IECC and the ASHRAE Standards 90.1-2001 and 90.1-2004. Results of the analysis are included in the Vol II Technical Report.

2. Technical Assistance

The Laboratory provided technical assistance to the TCEQ, PUCT, SECO, ERCOT, and several political subdivisions, as well as Stakeholders participating in improving the compliance of the Texas Building Energy Performance Standards (TREPS). The Laboratory also worked closely with the TCEQ to refine the integrated NOx emission reduction calculation procedures that provide the TCEQ with a standardized, creditable NOx emission reduction from energy efficiency and renewable energy (EE/RE) programs, which are acceptable to the US EPA.

Three activities have improved the accuracy of the creditable NOx emissions reduction from EE/RE initiatives contained in the TERP and have assisted the TCEQ, local governments, and the building industry with effective, standardized implementation and reporting.

3. NOx Emissions Reduction

Under the TERP legislation, the Laboratory must determine the energy savings from energy code adoption and, when applicable, from more stringent local codes or above-code performance ratings, and must report these reductions annually to the TCEQ.

Figure 1 shows the cumulative NOx emissions reduction through 2020 for the electricity and natural gas savings from the various EE/RE programs. In 2006, the cumulative NOx emissions reduction were calculated to be 17.52 tons/Ozone-Season-Day. By 2015, the cumulative NOx emissions reduction are projected to be 40.86 tons/Ozone-Season-Day.
4. Technology Transfer

The Laboratory, along with the TCEQ, is host to the annual Clean Air Through Energy Efficiency (CATEE) conference, which is attended by top experts and policy makers in Texas and from around the country. As the conference the latest educational programs and technology is presented, discussed, including efforts by the laboratory and others to reduce air pollution in Texas through energy efficiency and renewable energy. These efforts have produced significant success in bringing EERE closer to US EPA acceptance in the Texas SIP. The laboratory will continue to provide superior technology to the State of Texas through such efforts with the TCEQ and the US EPA.

To accelerate the transfer of technology developed as part of the TERP, the Laboratory has also made presentations at national, state and local meetings and conferences, which includes the publication of peer-reviewed papers. The Laboratory will continue to provide technical assistance in the TCEQ counties and communities working toward obtaining all SIP credit for the energy efficiency and renewable energy projects that we lower emissions and improving the air quality for all Texans.

These efforts have been recognized nationally by the US EPA. In 2007, the Laboratory was awarded a National Council of Excellence on Displayed Emissions Reduction (CEDER) by the US EPA so that these accomplishments, could be rapidly disseminated to other areas for their use. The benefits of CEDER include reducing the financial, technical, and administrative costs of determining the emissions reduction from EERE measures, continuing to accelerate implementation of EERE strategies in a visible clean air effort in Texas and other states, helping other states better identify and prioritize cost-effective clean air strategies from EERE, and communicating the results of quantification efforts through case-studies and a clearinghouse of information.
VOLUME I – SUMMARY REPORT

Energy Efficiency/Renewable Energy Impact
In The Texas Emissions Reduction Plan

OVERVIEW

The Energy Systems Laboratory (Laboratory), at the Texas Engineering Experiment Station, of the Texas A&M University System, is pleased to provide our fifth annual report, Energy Efficiency/Renewable Energy Impact in the Texas Emissions Reduction Plan (TERP), to the Texas Commission on Environmental Quality (TCEQ) in fulfillment of its responsibilities under Texas Health and Safety Code Ann. § 381.003 (c), Vernon Supp. 2002. This annual report:

- Provides an estimate of the energy savings and NOx reductions from energy code compliance in new residential construction in all ERCOT counties;
- Provides an estimate of the standardized, cumulative, integrated energy savings and NOx reductions from the TERP programs implemented by the Laboratory, SECO, the PUC, and ERCOT in all ERCOT Texas;
- Describes the technology developed to enable the TCEQ to substantially reduce or eliminate reduction credits from energy efficiency and renewable energy initiatives (EE/RE) to the U.S. Environmental Protection Agency (US EPA), including the development of a web-based emissions reduction calculator;
- Outlines progress in advancing EE/RE strategies for credit in the Texas State Implementation Plan (SIP);

The report is organized in three volumes:

Volume I – Summary Report – provides an executive summary and overview;
Volume II – Technical Report – provides a detailed report of activities, methodologies and findings;
Volume III – Technical Appendix – contains detailed data from simulations for all ERCOT counties in Texas included in the analysis.

Legislative Background

The TERP was established in 2001 by the 77th Legislature through the enactment of Senate Bill 5 to:

- Ensure that Texas air meets the Federal Clean Air Act requirements (Section 707, Title 42, United States Code); and
- Reduce NOx emissions in non-attainment and near-non-attainment counties through mandatory and voluntary programs, including the implementation of energy-efficiency and renewable energy programs (EE/RE).

To achieve the clean air and emissions reduction goals of the TERP, Senate Bill 5 created a number of EERE programs for credit in the SIP:

- Adopted state-wide Texas Building Energy Performance Standards (TIPPS) as the building energy code for all residential and commercial buildings;
- Provides that a municipality or county may request the Laboratory to determine the energy impact of proposed energy code changes;
- Provides for an annual evaluation by the Public Utility Commission of Texas (PUC), in cooperation with the Laboratory, of the emissions reduction of energy demand, peak electric loads and the associated air contaminant reductions from utility-sponsored programs established under Senate Bill 5 and utility-sponsored programs established under the electric utility restructuring act (Sections 39.903 (Utilities Code));
- Establishes a 2% per year electricity reduction goal each year for facilities of political subdivisions in non-attainment and near-threshold-attainment counties from 2002 through 2007; and
- Requires the Laboratory to report annually to the TCEQ the energy savings (and resultant emissions reductions) from implementation of building energy codes and to identify the municipalities and counties whose codes are more or less stringent than the unamended code.

August 2007

Energy Systems Laboratory, Texas A&M University System
The 78th Legislature (2003), through HB 1365 and HB 3235, amended TERP to enhance its effectiveness with additional energy efficiency initiatives, and includes:

- Requires the TCEQ to conduct outreach to non-attainment and near-non-attainment counties on the benefits of implementing energy efficiency measures in a way to meet its air quality goals under the federal Clean Air Act;
- Requires the TCEQ develop a methodology for computing emissions reductions from energy efficiency measures;
- Authorized a voluntary Energy-Efficient Building Program at the General Land Office (GLO), in consultation with the Laboratory, for the accreditation of buildings that exceed the state energy code requirements by 15% or more;
- Authorized municipalities to adopt an optional, alternate energy code compliance mechanism through the use of accredited energy efficiency programs determined to be code-compliant by the Laboratory, as well as the US EPA’s Energy Star New Homes program; and
- Requires the Laboratory to develop and administer a statewide training program for municipal building inspectors seeking to become code-certified inspectors for enforcement of energy codes.

The 79th Legislature (2003), through SB 20, HB 2841 and HB 2129, amended Senate Bill 5 to enhance its effectiveness by adding the following additional energy efficiency initiatives:

- Requires 5,880 kW of generating capacity from renewable energy technologies by 2015;
- Includes 500 MW from non-wind renewables;
- Requires the PUCT to establish a target of 10,000 megawatts of installed renewable capacity by 2025;
- Requires the TCEQ to develop methodology for computing emissions reductions from renewable energy initiatives and the associated credits;
- Requires the Laboratory to assist the TCEQ in quantifying emissions reduction credits from energy efficiency and renewable energy programs;
- Requires the Texas Environmental Research Consortium (TERC) to contract with the Laboratory to develop and annually calculate creditable emissions reduction from wind and other renewable energy resources for the state’s SIP; and
- Requires the Laboratory to develop at least three alternative methods for achieving a 15% greater potential energy savings in residential, commercial and industrial construction.

The 80th Legislature (2007), through SB 12, and HB 3693 amended Senate Bill 5 to enhance its effectiveness by adding the following additional energy efficiency initiatives:

- Requires the Laboratory to provide written recommendations to the State Energy Conservation Office (SECO) about whether or not the energy efficiency provisions of latest published edition of the International Residential Code (IRC) or the International Energy Conservation Code (IECC) are equivalent to or better than the energy efficiency and air quality achieve under the editions adopted under the 2001 IRC/IECC. The Laboratory shall make its recommendations no later than six months after publication of new editions at the end of each three-year code development cycle of the International Residential Code and the International Energy Conservation Code.
- Requires the Laboratory to consider comments made by persons who have an interest in the adoption of the energy codes in the recommendations made to SECO.
- Requires the Laboratory to develop a standardized report format to be used by providers of home energy ratings, including different report formats for rating newly constructed residences from those for existing residences. The form must be designed to give potential buyers information on a structure’s energy performance, including: insulation; types of windows; heating and cooling equipment; water heating equipment; additional energy conserving features, if any; results of performance measurements of building tightness and forced air distribution; and an overall rating of probable energy efficiency relative to the minimum requirements of the International Energy Conservation Code or the energy efficiency chapter of the International Residential Code, as appropriate.
- Encourages the Laboratory to cooperate with an industry organization or trade association to develop guidelines for home energy ratings, provide training for individuals performing home energy ratings and providers of home energy ratings; and provide a registry of completed ratings for newly constructed residences and residential improvement projects for the purpose of computing the energy savings and emissions reduction benefits of the home energy ratings program.
• Requires the Laboratory to include information on the benefits gained from this program in an annual report to the commission.

Laboratory Funding for the TERP

The Laboratory received $18,000 in FY 2002; $285,000 in FY 2003; $500,421 in FY 2004; $1,529,019 in FY 2005; and $932,019 in FY 2006. The Laboratory can also use funds competitively awarded Federal grants to provide the needed statewide training for the new mandatory energy codes and to provide technical assistance to cities and regions in helping them implement adoption of the legislated energy efficiency codes, and at award from the US EPA in the Spring of 2007 to establish a Center of Excellence for the Determination of Emissions Reduction (CEDER) which will help to enhance the IE/RE emissions calculations.

Accomplishments Since January 2006

Since January of 2006, the Laboratory accomplished the following:
- Calculated energy and resultant NOx reductions from implementation of the Texas Building Energy Performance Standards (IECC/NEC codes) in residential and commercial construction for all non-metropolitan and near non-metropolitan counties.
- Enhanced the web-based "Emissions Reduction Calculator - Code" for determining emissions reduction from energy efficiency improvements in residential and commercial construction, municipal projects and renewable energy projects.
- Enhanced the Laboratory's IECC/IRC Code-Traceable Test Suite for determining emission reduction due to code and above-code programs.
- Conducted development and testing of key procedures for validating simulations of building energy performance.
- Provided energy code training workshops, including: 12 residential, 4 commercial IECC/IRC energy code training sessions, 13 code-compliant software sessions, 3 ASHRAE Standard 62.1 sessions, and 9 ASHRAE Standard 90.1 workshops throughout the State of Texas.
- Maintained and updated the Laboratory's Senate Bill 5 website.
- Maintained a "builder's" residential energy code Self-Certification Form (Ver. 1.5) for use by builders outside the municipality.
- Responded to hundreds of phone and email inquiries on code implementation and verification issues.
- Analyzed the stringency of several residential and commercial energy codes, including the 2006 IECC and ASHRAE Standard 90.1-2001 and Standard 90.1-2004.
- Presented an invited presentation about Texas' NOx emissions reduction calculations at the US EPA's Air Innovation Conference in September 2006, in Denver, Colorado.
- Taught the Energy Leadership and Emissions Reduction Conference in November 2006, in Houston, Texas. Conference sessions included key talks by the TCQO, EPA, DOE and the Laboratory about quantifying emissions reduction from IE/RE opportunities and guidance on key energy efficiency and renewable energy topics.

- Provided technical assistance to the TCEQ regarding specific issues, including:
  o Enhancement of the standardized, unweighted NOx emissions reduction reporting procedure1 to the TCQO for ELEP, UCST, SECO and OPCOT IE/RE projects;
  o Enhancement of the procedures for weather normalizing NOx emissions reduction from power provided by wind energy providers to base-year calculations;
  o Quantified emissions reduction from the new, federally-mandated SEER 13 air conditioner standard (starting in January 2008).
- Enhanced the web-based emissions reduction calculator, including:
  o Expanded the emissions reduction calculator to include all counties in ERCOT;
  o Updated, cleaned and posted weather data archive for 17 NOAA stations in Texas;
  o Expanded emissions reductions to include SEER 13 as conditions;
  o Continued the enhancement of the new computer architecture to allow for synchronous calculations, user accounts, and code compliance.

---

1 These procedures are currently under review by the USDOE through the National Renewable Energy Laboratory (NREL).
• Developed 15% above code recommendations for residential buildings;
• Developed 15% above code recommendations for commercial and industrial buildings; and
• Continued the development of verification procedures, including:
  o Completion of calibrated simulation of a high-efficiency office building in Austin, TX;
  o Worked towards a calibrated simulation of an office building;
  o Worked towards a calibrated simulation of a K-12 school; and
  o Completed the calibrated simulation of a Habitat for Humanities residence.

Technology Transfer

To accelerate the transfer of technology developed as part of the Senate Bill 5 program, the Laboratory:
• Delivered "Statewide Air Emissions Calculations from Wind and Other Renewables," to the Texas Commission on Environmental Quality in August 2006, including stakeholder’s meetings to gather input from the industry and the review incorporation of information from ERCOT’s Renewable Energy Credit Program site; [webpage URL deleted].
• Developed a method to predict on-site wind speeds using Artificial Neural Networks (ANN) and developed improvements to the daily modeling procedures using ANN-derived hourly wind speeds.
• Developed degradation analysis to determine if degradation could be observed in the measured power from Texas wind farms.
• Developed empirical enrollment analysis of the measured power production from a wind farm and applied to the Indian Mesa wind farm.
• Developed a database of other renewable projects in Texas, including: solar photovoltaic, geothermal, hydroelectric, and Landfill Gas-fired Power Plants.
• Developed estimation techniques for hourly solar radiation from limited data sets.
• Along with the TCEQ and the US EPA, is host to the annual Clean Air Through Energy Efficiency (CATEE) Conference attended by top Texas experts and policy makers and national experts.
• Was granted a National Center of Excellence on Displaced Emissions Reduction (CEDER) by the US EPA.

The benefits of CEDER include:
• reducing the financial, technical, and administrative costs of determining the emissions reduction from EE/RE measures;
• continuing to accelerate implementation of EE/RE strategies as a viable clean air effort in Texas and other states;
• helping other states identify and prioritize cost-effective clean air strategies from EE/RE; and
• communicating the results of quantification efforts through case-studies and a clearinghouse of information.

In addition to the tasks listed above, the Laboratory delivered presentations regarding the Senate Bill 5-related work, including:
• Presentation at Rice University, Civil Engineering Department, September 2006.
• Presentation at Clean Air Conference, University of Houston, October 11-12.
• Presentation at the American Waste Management Association Meeting, Austin, February 2007.
• Presentation at Baylor University, Mechanical Engineering Department, February 2007.
• Presentation at U.S. Congress about Texas NOx emissions reduction for ASHRAE Tech Briefing, March 2007.
• Presentation at ASHRAE Carbon Toolkit Workshop, March, 2007 (by phone).
• Presentation at EPA Conference, April 2007 (by phone).
• Presentation of seven papers at the 15th Symposium on Improving Building Systems in Hot and Humid Climates, in Orlando, Florida, July 2006, including:

Presented two papers at the 2nd SimBuild Conference, Boston, MA, August 2006:

Presented one Paper at the ACEEE Summer Study on Energy Efficiency, Asilomar, California, August 2006:

Presented one Paper at the 6th International Conference for Enhanced Building Operations, Shanghai, China, October 2006:

The Laboratory has and will continue to provide leading-edge technical assistance to the TCEQ, counties and communities working toward obtaining full SIP credits for the energy efficiency and renewable energy projects that are lowering emissions and improving the air quality for all Texans. The Laboratory will continue to provide superior technology to the State of Texas through efforts with the TCEQ and US EPA. The efforts taken by the Laboratory have produced significant success in bringing EERE closer to US EPA acceptance in the SIP. These activities were designed to more accurately calculate the credited NOx emissions reduction from EERE initiatives contained in the TERP and to assist the TCEQ, local government, and the building industry with standardized, effective implementation and reporting.
Energy and NOx Reductions From New Residential and Commercial Construction

State adoption of the energy efficiency provisions of the International Residential Code (IRC) and International Energy Conservation Code (IECC) became effective September 1, 2001. The Laboratory has developed and delivered training to assist municipal inspectors to become certified energy inspectors. The Laboratory also supported code officials with guidance on interpretation as needed. This effort, based on a requirement of SB 3235, 78th Texas Legislature, supports a more uniform interpretation and application of energy codes throughout the state. In general, the State is experiencing a transition from lower energy efficiency products to high energy efficiency products. These include: Low Solar Heat Gain windows, higher efficiency appliances, increased insulation, lower thermal loss ducts and in building participation in "above-code" code programs such as Energy Star New Homes, which previously had no state baseline and almost no participation.

In the counties served by ERCOT, the resultant annual NOx reductions in 2006 were calculated to be 361 tons NOx/year, which include:

- 274 tons NOx/year from single-family and multi-family residential (409,025 MWh/year saved);
- 61 tons NOx/year from commercial construction (85,557 MWh/year saved); and
- 26 tons NOx/year from natural gas savings from single-family, multi-family residential and commercial construction (576,880 MBtu/year saved).

For the peak ozone season day (O3SD), the NOx emissions reduction in 2006 are calculated to be 2.23 tons of NOx peak O3SD, which represents:

- 1.70 tons NOx/day from single-family and multi-family residential (2,564 MWh/day saved);
- 0.38 tons NOx/day from commercial (568 MWh/day saved); and
- 0.15 tons NOx/day from natural gas savings from single-family, multi-family and commercial construction (1,266 MMBtu/day saved).

Beginning in 2005, the Laboratory worked with the TCEQ to develop a standardized, integrated NOx emissions reduction across state agencies implementing EE/RE programs so that the results can be evaluated consistently. As required by the legislation, the TCEQ receives reports from the Laboratory on savings from code compliance and renewables; from the Laboratory, in cooperation with the Electric Reliability Council of Texas (ERCOT), on the savings from electricity generated from wind power; from the Public Utilities Commission of Texas (PUC) on the impacts of the utility-administered programs designed to meet the mandated energy efficiency goals of SB7 and SB8; and from the State Energy Conservation Office (SECO) on the impacts of energy conservation in state agencies and political subdivisions.

- In 2006, total cumulative annual energy savings from code-compliant residential and commercial construction is calculated to be 1,428,644 MWh/year (17.0% of the total electricity savings); savings from retrofit to Federal buildings is 10,073 MWh/year (1.2%); savings from furnace pilot light retrofit is 2,548,904 MBtu/year; savings from the PUC’s Senate Bill 5 and Senate Bill 7 programs is 1,376,334 MWh/year (16.3%); savings from SECO’s Senate Bill 5 program is 297,761 MWh/year (3.5%); electricity savings from green power purchases (wind) is 4,752,708 MWh/year (56.6%); and savings from residential air conditioner retrofits is 403,879 MWh/year (4.8%). The total savings from all programs is 8,396,023 MWh/year.

- The total cumulative O3SD energy savings from code-compliant residential and commercial construction is calculated to be 7,723 MWh/day (20.9%); savings from retrofit to Federal buildings is 299 MWh/day (1.2%); savings from furnace pilot light retrofit is 5,819 MWh/day; savings from the PUC’s Senate Bill 5 and Senate Bill 7 programs is 2,770 MWh/day (14.6%); savings from SECO’s Senate Bill 5 program is 804 MWh/day (3.1%); electricity savings from green power purchases (wind) are 10,305 MWh/day (60.0%); and savings from residential air conditioner retrofits are 2,879 MWh/day (11.1%). The total savings from all programs is 25,760 MWh/day, which would be a 1,073 MW average hourly load reduction during the O3SD period.

August 2007
Energy Systems Laboratory, Texas A&M University System

1 These NOx emissions reductions were calculated with the US EPA’s 2007 eGRID for annual (2% capacity factor) and Climate Season Day O3SD.
2 This includes the savings from 2001 through 2006.
3 This means the conditioners in existing homes are replaced with the most efficient SEER 11 units, versus an average of SEER 11, which is slightly more efficient than the previous year's standard of SEER 10.
• The total cumulative annual NOx emissions reduction from code-compliant residential and commercial construction is calculated to be 1,810 tons-NOx/year (17.9% of the total NOx savings); savings from new vehicles retired in 2016 are 58 tons-NOx/year (10.6% of the total NOx savings); savings from commercial buildings is 81 tons-NOx/year (15.0% of the total NOx savings).

• In 2013, the total cumulative annual electric energy savings from code-compliant residential and commercial construction is calculated to be 3,024,561 MWh/year (16.8% of the total electricity savings); savings from new buildings are 1,678 MWh/year (2.6%).

• The total cumulative annual NOx emissions reduction from code-compliant residential and commercial construction is calculated to be 2,121 tons-NOx/year (17.8% of the total NOx savings); savings from new buildings are 1,569 tons-NOx/year (26.6% of the total NOx savings).

Figure 2: Cumulative OSD NOx Emissions Reduction Projected through 2020.

Technology for Calculating and Verifying Emissions Reduction from Energy Used in Buildings

In 2004 and 2005, the Laboratory developed a web-based Emission Reduction Calculator, known as "eCalc," which contains the underlying technology for determining NOx emissions reduction from power plants that generate the electricity for the user. The emissions reduction calculator is being used to calculate emissions reductions for consideration for SIP credits from energy efficiency and renewable energy programs in the TERP.

In 2006, the Laboratory enhanced the calculator to provide additional functions and usability, including:
- Enhanced the web-based "Emission Reduction Calculator" for determining emissions reduction from energy efficiency improvements in residential and commercial construction, municipal projects and renewable energy projects;
- Enhanced the Laboratory’s IECC/HKC Code-Traceable Test Suite for determining emissions reduction due to code and model code programs;
- Enhanced web-based emissions reduction calculation, including:
  - Expanded emissions reduction calculator to include all counties in ERCOT;
  - Gathered, cleaned and ported weather data archive for 17 NOAA stations.

*eCalc reports NOx, SOx, and CO2 emissions reduction from the U.S. EPA eGRID database for power plants in the ERCOT region.

August 2007

Energy Systems Laboratory, Texas A&M University System
o Expanded emission reduction to include SFP 13 air conditioners for new and existing homes;
   - Continued the enhancement of the new computer architecture to allow for synchronous
     calculations, user accounts, and code compliance;

- Continued the development of verification procedures, including:
  - Compliance of calibrated simulation of a high-efficiency office building in Austin, Texas;
  - Worked towards a calibrated simulation of an office building;
  - Worked towards a calibrated simulation of a K-12 school;

- Conducted the calibrated simulation of a Habitat for Humanities residence;

- Expanding the building solution to include a 70% reduction in energy efficiency at the K-12 schools;

- Completing the new model for municipal water and waste-water calculations; and

- Developing verification procedures for the savings including a utility bill analysis of representative
  residential buildings built before and after the implementation of the state-wide building code.

**Planned Focuses for 2007/2008**

In FY 2007, the Energy Systems Laboratory is continuing its cooperation efforts with the TCEQ, PUCT, SECO, US EPA and others to ensure EEERE initiatives remain a cost-effective solution to clean air, and continue to support the energy efficiency and renewable energy opportunities of the TURP. In FY 2007 the laboratory team will:

- Continue to assist the TCEQ to obtain SIP credits from energy efficiency and renewable energy using the Laboratory's Emissions Reduction Calculator technology;

- Verify, document and report energy efficiency and renewable energy savings in all SIP EEERE programs that are SIP in each state and non-state energy saving activities using the TCEQ/US EPA approved technology;

- Assist the PUCT with determining emission reduction credits from energy efficiency programs funded by SB 7 and SB 5;

- Assist political subdivisions and Councils of Governments with calculating emissions reduction from local cost-effective and voluntary EEERE programs reported to SECO for SIP inclusion;

- Provide additional low-cost methods and techniques to implement 15% above code energy efficiency in low-priced and moderately-priced residential housing and commercial construction;

- Work support from the US DOE and SECO, continue to develop the development of a web-based code-compliance calculation tool for Austin, Texas (TCP projects), and expand the use of such a calculator to other areas of Texas (i.e., the International Code Compliance Calculator -- ICC for Texas);

- Continue to develop affordable procedures for calculating NOx emission reduction from green renewable technologies; including wind power, solar energy and geothermal energy systems;

- Continue development of the standardized, integrated NOx emissions reduction methodologies for calculating and reporting NOx reductions, including a unified database framework for all projects supporting the TCEQ utilizing off-the-shelf software for inventory automation within the TCEQ project planning and support systems;

- Complete the analysis of the stringency of several residential and commercial energy codes, including:
  - ANUAE Standard 90.1-2004, and Title 2006 IECC, and;
  - With the assistance of the TCEQ and EPA, expand the analysis to include all counties in Texas;

- With the assistance of the TCEQ and EPA, expand the analysis to include new base year calculations;

- Complete the role in the National Center of Excellence in Displaced Emissions Reduction (CEDER) as designated by the US EPA, and;

- Host the 2008 Clean Air Through Energy Efficiency (CAFE) conference to be held in Dallas, Texas.

The Laboratory will continue to provide technical assistance to the TCEQ, counties and communities working toward obtaining full SIP credits for the energy efficiency and renewable energy projects that are lowering emissions and improving the air quality for all Texans.

If any questions arise, please contact us by phone at 512-862-2304 or by email at ESELinfo@utexas.edu.
