# Water Loss Test Results for the West Main Pipeline United Irrigation District of Hidalgo County 

## Summary

In 2004, United Irrigation District of Hidalgo County (United) replaced 1.7 miles of their West Main Canal with underground reinforced concrete pipeline (Figure 3). The West Main, a concrete lined canal (Figure 1), meanders northward for approximately 10 miles, beginning at the district's $3^{\text {rd }}$ re-lift pump station at 2 Mile Road and just east of Inspiration Road. Over this stretch, the canal reduces in capacity and narrows in top width from 24 to 3.5 feet.

Figure 1. West Main Canal

Prior to the pipeline installation, water loss tests were conducted on three segments of the canal using the ponding test method to measure seepage. The ponding tests took place during July 2001 and February 2002, respectively.

The water loss rates for the West Main Canal were measured between $2.11-2.29$ $\mathrm{gal} / \mathrm{ft}^{2} / \mathrm{day}$, or 132.2 - $214.3 \mathrm{ac}-\mathrm{ft} / \mathrm{mi} / \mathrm{yr}$. Table 1 summarizes the test results using methods commonly used for characterizing water loss from canals.

After completion of the new pipeline and at the district's request, we started a series of water loss tests to evaluate the performance of the pipeline and document the water savings. Currently, six tests have been conducted between March 2004 and August 2006. Table 2 summarizes the test results.

The first two tests were conducted in March and May of 2004 with water losses measured at 26,402 and $40,990 \mathrm{gal} / \mathrm{mile} /$ day, or projected annual losses of 30.0 and $46.0 \mathrm{ac}-\mathrm{ft} / \mathrm{mi} / \mathrm{yr}$, respectively. When compared to losses measured from the original canal we see an average water savings of $78 \%$. While this would be considered much improvement, the district's expectations for their new pipeline were higher.

Following minor repairs, due to the apparent leakage occurring along side of the pipeline (shown in figure 2); we retested the pipeline in July 2004 and again in May 2005 and August 2006. Test results found that losses were reduced on average by $1448 \mathrm{gal} / \mathrm{mile} /$ day or a projected annual loss of $1.6 \mathrm{ac}-\mathrm{ft} / \mathrm{yr}$; a $95.7 \%$ water loss reduction compared with Test 2 , and as much as $\mathbf{9 9 \%}$ savings when compared to the original canal losses.

## United Irrigation District of Hidalgo County

Figure 3. United Irrigation District map shows the location of the new West Main Pipeline section.

## Pipeline Testing Procedures

The West Main Pipeline was tested using the ponding method, measuring the total water loss rate. The total loss test accounts for all leaks occurring from gates, valves, and pipeline joints that are either undetectable or are difficult to measure.

These tests were performed under the district's normal operating water levels. Once the pipeline was filled, all downstream checkgates and turnout valves were inspected for leaks.

After the head gate was shut, water surface elevations were measured at selected standpipe stations with a water sounding meter shown in Figure 4 and referenced to the inside top rim of the standpipe. Each test lasted between 2.5 to 4 hours, taking a measurement at 30 minute intervals (6-9 measurements per test).

Our team was provided with basic design and attribute information on the new pipeline from the assigned engineering firm. Based on their

Figure 4. Askar is shown here measuring the drop in water level with the sounding meter. data, we assumed several parameters:

- All box structure walls and ceilings are one foot thick;
- The 12 inch standpipe nor the box structure at station $1+20$ was consider in the test segment due to the location of the head gate within the box structure;
- That all 12 inch standpipes due not extend past the inside ceilings of the box structures. Once the water level drops below the bottom of the standpipe the surface area and volume of the box structure as assumed (Figure 5).

Figure 5. Inside view of a 12 inch standpipe and box structure.

The box structures and selected standpipes were surveyed and referenced using a survey grade GPS instrument and a transit unit. The box structure elevations are based on an average of the GPS measurements on 3 or more corners (see Figure 6). Table 4 provides the survey measurements in Appendix A, and a foldout diagram of the pipeline is provided at the back of the report.

## Appendix C: Other Reported Seepage Rates and Water Loss Test Results

Texas Cooperative Extension has conducted approximately 50 total loss tests and seepage loss tests in the Lower Rio Grande River Basin since 1998. The results are summarized in Tables $10-12$. Table 13 gives seepage rates versus lining type as reported in the scientific literature.

Table 10. Results of seepage loss tests conducted by Texas Cooperative Extension in the Lower Rio Grande River Basin.

| Test ID | Year | Canal <br> Width <br> (ft) | Canal <br> Depth <br> (ft) | Class* | Loss Rate |
| :---: | :---: | :---: | :---: | :---: | :---: |
| gal/ft2/day ac-ft/mi/yr |  |  |  |  |  |

Lined

| 16HC2 | 03 |  |  | M |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| LF1 | 03 | 12 | 5 | M | 1.77 | 152.9 |
| LF2 | 03 | 10 | 6 | M | 4.61 | 369.1 |
| MA4 | 03 | 12 | 5 | S | 8.85 | 529.7 |
| SJ4 | 00 | 15 | 4 | M | 1.17 | 111.2 |
| SJ5 | 02 | 14 | 5 | M | 1.38 | 145.5 |
| UN1 | 01 | 12 | 6 | M | 2.32 | 217.7 |
| UN2 | 01 | 8 | 3 | M | 2.09 | 121.2 |

Unlined

| BR1 | 03 | 60 | 11 | M | 3.14 | 794.6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MA3 | 03 | 19 | 5 | S | 13.9 | 1690.1 |
| RV1 | 03 | 38 | 4 | M | 0.15 | 23.0 |
| SB4 | 02 | 16 | 4 | S | 0.64 | 68.3 |
| SB5 | 02 | 18 | 3 | S | 1.67 | 188.3 |
| SB6 | 02 | 20 | 5 | S | 1.44 | 189.0 |
| SB7 | 02 | 16 | 4 | S | 0.42 | 47.4 |
| SB8 | 02 | 20 | 5 | S | 0.83 | 104.0 |

*Classification of canal: $\mathrm{M}=$ main, $\mathrm{S}=$ secondary

Table 11. Results of total loss tests in lined canals (leaking gates and valves may have contributed to measured loss rates) conducted by Texas Cooperative Extension in the Lower Rio Grande River Basin.

| Test ID | Year | Canal <br> Width (ft) | Canal <br> Depth (ft) | Class* | Loss Rate <br> gal/ft2/day ac-ft/mi/yr |
| :---: | :---: | :---: | :---: | :---: | :---: |

Lined

| 16HC1 | 03 | 14 | 5 | M | 1.89 | 192.4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## United Irrigation District

Helpful planning and assistance in the pipeline tests was provided by the District office personnel and canal riders.
