[Blank Page in Original Bulletin]

This is the annual Fertilizer Control Bulletin. It contains statistics regarding fertilizers sold in Texas, information regarding the fertilizer law, and analysis of samples of the fertilizer sold by different manufacturers.

The total sales of fertilizer in Texas for 1941-42 were 134,560 tons. In 1940-41 the sales were 129,758 tons. In 1939-40 they were 116,307 tons. Cottonseed meal sold as a feed but used as a fertilizer was not included in these totals. Sales of fertilizer were about 5% more than last year. Practically all the sales of mixed fertilizers were confined to about 20 analyses.

Tables are given showing the extent to which the various fertilizer manufacturers met or exceeded their guarantees. The cost of nitrogen, phosphoric acid, and potash were higher in 1941-42 than in 1940-41.

The subjects of vitamin B₁ and water culture are discussed and other information is given about fertilizers.

COMMERCIAL FERTILIZERS IN 1941-42

**G. S. Fraps, State Chemist, T. L. Ogier, Associate State Chemist,
and S. E. Asbury, Assistant State Chemist**

Fertilizer laws require fertilizer to be correctly labeled so that the purchaser can know what he is getting. The object of the fertilizer law is to protect the farmer or other users of fertilizer against misrepresentation of the composition of fertilizing value of the fertilizer as well as manufacturers and dealers against unfair competition due to such misrepresentation.

The first Texas fertilizer law was passed in 1899. It was revised and amended in 1911. The results of the fertilizer inspection has been published in bulletins of the Texas Agricultural Experiment Station regularly since 1906. This is the fortieth Fertilizer Control Bulletin. It contains statistics, definitions of terms, a report on the analyses made in enforcing the provisions of the fertilizer law, and information regarding the use of fertilizers.

EXPLANATION OF TERMS

Nitrogen refers to the total nitrogen in the fertilizer. It is necessary in proper amounts for the development of all parts of the plant, but occasionally an excess of nitrogen delays maturity and is liable to promote growth of stalk and leaves at the expense of fruit. Nitrogen is needed by many Texas soils, especially the sandy soils in the eastern parts of the State. Since nitrogen is used in comparatively large quantities by plants and is, to some extent, washed from the soil, it is usually the first element to become depleted.

Available phosphoric acid is the phosphoric acid (P_2O_5) in fertilizers which can be taken up quickly by plants. Phosphoric acid promotes the fruiting of plants, though it is also necessary for the development of all parts of the plant.

Total phosphoric acid is the entire quantity of the phosphoric acid (P_2O_5) present, whether highly available or not. A guarantee of total phosphoric acid in place of available is made in bone, tankage, rock phosphate, and basic slag.

Potash guaranteed in a fertilizer is required by the law to be soluble in water. Potash, like nitrogen, is needed by all parts of the plant, but especially by stalk and leaves. An excess of potash may delay maturity and is liable to promote growth of the stalk and leaves at the expense of the fruit. When potash is abundantly supplied, plants may take up more than they need. Potash is present in soils more abundantly than nitrogen or phosphoric acid.

Valuation per ton represents the approximate average cost at retail of the plant food in the unmixed fertilizer. It is usually smaller than the price at which the mixed fertilizer is sold, but since it is an average, it may be greater than the prices of some of the unmixed fertilizer materials. The selling price includes cost of mixing, bags, transportation, the profit of the manufacturer, if any, and that of the dealer. The valuations are decided on about September 1, and the prices often change before the principal fertilizer season, which is February to April in Texas. The valuation sums up the value of the three plant foods shown in the analysis into a single figure, and is convenient for this purpose. The fertilizer law permits a deficiency of less than ten per cent in one plant food to be compensated by an excess of another, but if the valuation is four per cent less than the guaranteed valuation, a rebate must be paid to the purchaser. The valuation found compared with the valuation guaranteed shows whether or not the fertilizer value as a whole is better or poorer than the guarantee as a whole. The following prices were used for calculating valuations in 1941-42.

	Cents per pound
Nitrogen	12.0
Available phosphoric acid	6.5
Total phosphoric acid in Thomas phosphate, tankage, and bone meal.....	4.5
Total phosphoric acid in rock phosphate	1.5
Potash	6.5

Names of fertilizers. Fertilizers are frequently named by numbers, such as a 4-8-4 fertilizer, a 6-12-6 fertilizer and so on. In such names, the first figure stands for the percentage of nitrogen, the second for the percentage of available phosphoric acid, and the third for the percentage of water-soluble potash. This is a short and accurate method of naming fertilizers.

Information on the Fertilizer Bag and Tag

A fertilizer-tax tag is required to be placed on every bag of fertilizer before it is offered for sale or sold. The guaranteed analysis of the fertilizer is required by law to be printed on the bag or on the tag attached to the bag, so that the purchaser can see what he is buying. Total phosphoric acid may be guaranteed for bone or tankage instead of available phosphoric acid. A guarantee of total phosphoric acid is required in Thomas phosphate or rock phosphate. The information required on the package is as follows:

Net weight
 Name of fertilizer in full
 Name and address of manufacturer
 Guaranteed analysis:
 Nitrogen, per cent
 Available phosphoric acid, per cent
 Potash, per cent

How to Calculate the Valuation

The valuation of a fertilizer is calculated by multiplying the composition by the valuation of each unit of plant food and adding the products.

A unit is one per cent of a ton, or 20 pounds; so if the valuation of nitrogen is 12 cents a pound, the valuation of a unit is $12 \times 20 = \$2.40$. The valuation of a unit of available phosphoric acid at 6.5 cents a pound would be $6.5 \times 20 = \$1.30$; the valuation for a unit of potash at 6.5 cents a pound would be $\$1.30$. The following is an example of a calculation at the prices given above:

VALUATION OF 4-8-4 FERTILIZER

Nitrogen	4 x \$2.40 = \$ 9.60
Available phosphoric acid	8 x \$1.30 = \$10.40
Potash	4 x \$1.30 = \$ 5.20
Total valuation per ton	\$25.20

FERTILIZER ANALYSES TO BE SOLD IN 1942-43

The grades of fertilizer sold in Texas have been limited in number for 17 years. This standardization aids the farmer to become familiar with the different kinds of fertilizer, enables him to decide more readily on the proper kind to be used, enables the agricultural worker to make definite recommendations, and reduces the cost of manufacture and handling, thereby also reducing the cost to the consumer.

At a meeting on July 8, 1942, of fertilizer manufacturers, State Chemists, agricultural officials, and representatives of the Office of Price Administration, the War Production Board, the U. S. Department of Agriculture, and the National Fertilizer Association, the following grades of mixed fertilizer were adopted for use in Texas for the season beginning Sept. 1, 1942: 0-14-7, 3-15-0, 3-12-6, 4-8-12, 4-12-4, 4-10-7, 10-10-0 and 10-20-0. At the usual meeting of the manufacturers, the eighteenth for Texas, and the ninth joint conference, the guarantee for nitrogen in sulphate of ammonia was raised from 20.5 to 20.6. Muriate of potash 60.0% was added to the list of materials, while 20% kainite was eliminated. The grades adopted for Texas are given in Table 1.

Table 1. Grades of fertilizer adopted for sale in Texas September 1, 1942 to August 31, 1943

0-14-7	4-10-7
3-15-0	4-12-4
3-12-6	10-10-0
4-8-12	10-20-0

MATERIALS

Activated sludge	Muriate of potash, 50% and 60%
Bat Guano	Nitrate of soda, 16%
Bone meal	Nitrate of soda and potash 15-0-14
Calcium nitrate	Sheep manure
Castor pomace	Sulphate of ammonia, 20.6%
Cottonseed meal	Sulphate of potash, 48%
Cyanamid, 21% and 22%	Superphosphate, 18%, 20%, 32% and 45%
Ground phosphate rock	Soft Phosphate with colloidal clay
Lawn and Garden	Tankage
Manure Salts, 22, 25, and 30%	

Since some nitrogen compounds formerly used in fertilizers are now required for use as explosives the quantity of nitrogen available for use in fertilizers will be less than it has been in the past. In order to save transportation, labor, and sacks, it is desirable to use as little filler as possible. In order to save labor involved in cleaning and changing machinery, it is desirable to manufacture as few grades of fertilizer as possible.

QUANTITY SOLD

The quantities of commercial fertilizer sold in Texas for several seasons, from September 1 to August 31, are given in Table 2. These are the actual sales as reported by the manufacturers, and not the tag sales. The tag sales are always a little larger than the actual sales. The sales in 1941-42 were about 5% higher than last season. The largest sales so far made in Texas were 187,215 tons during the season 1928-29. Fertilizer statistics for a number of years to August 31, 1926, including sales by counties, have been published in Bulletin 350, and from 1926 to 1938 in Bulletin 572.

Table 2. Fertilizers sold in Texas, (not including cottonseed meal sold as feed but used as fertilizers).

	Tons
1905-06	18,500
1910-11	52,985
1913-14	77,400
1914-15	17,500
1919-20	56,700
1920-21	14,850
1921-22	33,000
1922-23	73,300
1923-24	126,179
1924-25	97,719
1925-26	121,747
1926-27	79,863
1927-28	139,126
1928-29	187,215
1930-31	64,424
1932-33	80,845
1935-36	60,016
1936-37	84,936
1937-38	79,640
1938-39	93,115
1939-40	116,307
1940-41	129,578
1941-42	134,560

Quantity of Sales by Grades

Table 3 contains the sales of fertilizer by grades for four seasons arranged in order according to sales in the season 1941-42. Sales of 4-8-4 fertilizer are highest of all. The 4-12-4 comes second, the 4-8-6 third and the 6-10-7 fourth. These are in the same order as they were the last three years.

The tonnage of cottonseed meal reported in Table 3 includes only that tagged with fertilizer tax tags and sold as a fertilizer.

Table 3. Fertilizer sales by grades in order of tonnage for 1941-42.

	Tons 1941-42	Tons 1940-41	Tons 1939-40	Tons 1938-39
4-8-4	34,732	34,477	30,705	24,171

Calcium nitrate	0	0	828	320
Total	134,560*	129,578	116,307	93,115

*This does not include 164 tons of 48% superphosphate and 6296 tons of 20% superphosphate distributed by the Agricultural Adjustment Administration.

COMPOSITION AND SELLING PRICES OF DIFFERENT GRADES OF FERTILIZER

Table 4 contains the average composition, the guaranteed valuation, the valuation found by analysis, and the average retail selling price per ton, of various grades of fertilizers. The average retail selling price is the average of the cash retail prices furnished to the fertilizer inspector by the dealers. The prices of the same fertilizer may be different in dif-

ferent towns on account of differences in cost of transportation or for other causes. The retail price includes handling costs, carrying charges, and the dealer's profits, as well as the cost of the plant food used in the materials from which the fertilizer is made. Prices of fertilizer were frozen by the Office of Price Administration in the spring of 1942.

Table 4. Average composition, valuation and selling prices of grades of fertilizers 1941-42

Grades of farm fertilizers	Number averaged	Nitro- gen per cent	Available Phos. acid per cent	Potash per cent	Guaran- teed valuation per ton	Valuation found per ton	Selling price per ton
0-12-4	6		12.26	4.23	\$20.80	\$21.43	\$26.00

Bone Fertilizer	1	3.15	24.31		27.53	29.44	200.00

*Total Phosphoric Acid

¹Also contains 50.97% free sulphur

The average valuations found by analysis (Table 4) exceed the guaranteed valuation in almost every case. The exceptions are 5-15-5, 6-24-0, 10-0-10, 10-10-0, 12-18-0, 23-27-17, 20.6% cyanamid, and 32% superphosphate. In most of these, however, the average valuations found by analysis are only slightly below the valuations guaranteed.

The flower, lawn and garden fertilizers are listed separately from the farm fertilizers in Table 4. The selling prices of these fertilizers range from \$62.50 to \$7500.00 per ton. The fertilizers in tablets sell at high prices. It is obvious from the table that while fertilizer for flowers, lawn and garden can be secured at reasonable prices, some of it sells at very high prices.

Cost of Plant Food

Table 5 contains the calculated retail cost of a pound of nitrogen, of available phosphoric acid, and of potash, in cents per pound, as calculated from the cash selling prices per ton given in Table 3 and the guaranteed composition. For the purpose of these calculations it was assumed that the prices were in the same ratio as the valuations. As the price of the same fertilizer may be different in places, these figures are not correct for any particular locality, but represent averages only, and are for purposes of comparison. The prices were collected by the inspectors from retail merchants handling fertilizers. Grades used extensively near the factories might average a lower price than those used at a distance on account of lower transportation costs. The fertilizers with the lowest cost of plant food are given first in the table.

Fertilizers for lawns, gardens and flowers are listed separately in Table 5. The prices of nitrogen range from 20.27 cents per pound to \$17.25 per pound. The cost of the phosphoric acid and potash are in similar proportions. The tablet fertilizers sell at the highest prices.

Cost of Nitrogen. The 10-20-10 was the cheapest source of nitrogen, sulphate of ammonia 20.5% was next, 6-24-0 third, 6-12-6 fourth and 6-10-7 fifth. Bone meal was the most expensive source of nitrogen, but is chiefly used for lawns or gardens. Of the farm fertilizers, 4-10-0 was the most expensive source of nitrogen, followed by raw bone meal and 4-8-4 as shown in Table 5. The cost of nitrogen was greater in most of the mixed fertilizers than in sulphate of ammonia because it costs to mix the fertilizer. The lowest-priced nitrogen in the mixed fertilizers was in the 10-20-10, followed in order by the 6-24-0, 6-12-6, and 10-10-0. The 4-8-4, the most popular fertilizer, was also high in price. Nitrogen was higher in price than last season in all fertilizers. The difference averaged .35 of a cent a pound higher for nitrogen in 10-20-10, 1.08 cents higher for that in 4-8-6, 1.19 cents higher for that in 4-12-4, and 1.50 cents per pound higher this year in 4-8-4.

Table 5. Approximate average cost of plant food in cents per pound.
Arranged in order of increasing cost 1941-42.

Grades	Nitrogen	Available Phosphoric acid	Potash
Superphosphate 32%		5.94	
10-20-10	11.33	6.14	6.14
Sulphate of Ammonia 20.5%	12.24

*Total phosphoric acid

Cost of Phosphoric Acid. The cheapest source of phosphoric acid was 32% superphosphate, then 10-20-10, followed by 6-24-0 and 6-12-6. The cost of available phosphoric acid was about .41 cent less per pound in 20 per cent superphosphate than in 18 per cent. Omitting the house-hold fertilizers, phosphoric acid was most expensive in activated sludge, then in 4-10-0, 0-12-4 and 4-8-4. Available phosphoric acid in 4-8-4 was .81 of a cent a pound higher, and in 4-12-4 was .64 of a cent a pound higher than last year.

Cost of Potash. 10-20-10 furnished the cheapest potash, followed by 6-12-6 and 6-10-7. Omitting the garden fertilizers, potash was the most expensive in 0-12-4, followed by 4-8-4, kainit 20% and 4-8-6. Potash in 4-8-4 cost .81 of a cent a pound more, and in 4-12-4 .64 of a cent a pound more than last year.

FREE ANALYSIS

Purchasers of commercial fertilizers for their own use (but not for sale), can secure a free analysis of a sample provided they take a legal sample. Those who desire the free analysis of a sample of commercial fertilizer should write for a blank, "Application for Free Fertilizer Analysis," to the State Chemist, College Station, Texas, before taking a sample. The proper sampling of a fertilizer requires care, and the law requires it to be taken in a certain way so that a fair sample is taken. If the sample is not properly taken, it does not represent the fertilizer sampled, and the analysis may be better or poorer than the goods actually are. This privilege of a free analysis applies only to fertilizers tagged, and sold under the fertilizer law and to samples properly taken so that they represent the goods sampled.

ANALYSIS OF FERTILIZERS, 1941-42

Samples of fertilizer were collected from the goods being sold in many towns and cities. The chief places of sales were visited several times.

Table 8 near the end of this Bulletin, contains a list of 1185 of the samples of fertilizer subjected to analysis in the season ending September 1, 1942. Practically all samples of fertilizer were collected by our inspectors. Analyses and inspection were made by S. E. Asbury, T. L. Ogier, Waldo Walker, M. Weber, Paul Kohn, M. Joseph, and C. B. McLarry.

Relation of Valuation Guaranteed to Valuation Delivered

Table 6 contains the average guaranteed valuation, and the average valuation found by our analyses, for all manufacturers doing business in Texas. In the preparation of this table, all analyses made were averaged, even though several were made of each brand. Fertilizer materials are included as well as mixed fertilizers.

Averages Below Guarantee

Whenever any lot of fertilizer is 4 per cent or more below guarantee, the law requires all persons who have sold this lot of fertilizer to make good the deficiency to all purchasers. This rebate is paid by the manufacturer to the dealer and by the dealer to the customer. The number of lots on which rebates were paid by each manufacturer is shown in Table 6.

Table 6. Average valuation of all fertilizers guaranteed and found in dollars per ton. 1941-42

Fillers

Many mixed fertilizers are made by mixing together ammonium sulphate, superphosphate, potash salts, and other materials containing nitrogen, phosphoric acid and potash. It is possible to make such fertilizers entirely from fertilizing materials, but it is often more desirable and less

expensive to make a mixture to the desired composition by the addition of sand, dolomite, or other material containing little or no fertilizing ingredients. Such additions are called fillers.

The materials used as filler in the grades of fertilizer offered for sale in Texas the past several seasons included sand, limestone, lime, dolomite, spent fullers earth, citrus pulp, gypsum, phosphate rock, cocoa meal, and coffee chaff.

Only small quantities of limestone or lime can be used because larger quantities will revert some of the available phosphoric acid to insoluble phosphoric acid, thereby decreasing the percentage of available phosphoric acid in the fertilizer and causing it to fall below guarantee.

The grades of fertilizer adopted for sale in the season of 1942-43 are so selected as to reduce the qualities of filler to as low a quality as possible.

NON-ACID FORMING FERTILIZERS

Ordinary fertilizers when used for a number of years on soils with a low buffer capacity may acidify a neutral soil, or make an acid soil more acid, and so are termed acid-forming fertilizers. Non-acid forming fertilizers are made by the addition of sufficient amounts of ground dolomite to neutralize the acidity, or by the selection of suitable fertilizing ingredients. Dolomite is a calcium magnesium carbonate. Limestone is not suitable because large quantities revert the available phosphoric acid of the fertilizer and cause it to become insoluble. In the eastern part of the United States, where fertilizers have been used for a long time and where the soils are already acid, ordinary fertilizer may not give as good yields of crops as non-acid forming fertilizers. Non-acid forming fertilizers are recommended for use on acid soils having a pH of 5.5 or lower and which are likely to become still more acid with ordinary fertilizers. Since Texas soils are generally only slightly acid, or even alkaline, the use of non-acid forming fertilizers is not at present necessary, except under exceptional conditions. Where the soils are neutral or slightly alkaline, as is the case in large areas of limestone soils, ordinary fertilizers are preferable to non-acid forming fertilizers. Some plants require slightly acid soils for best results. An acid-forming fertilizer may be better on an alkaline soil than a non-acid forming fertilizer. For further information see Progress Report No. 594.

Only two brands of fertilizer sold in Texas this season were claimed to be non-acid forming. Examinations was made of 24 samples, with the results given in Table 7. Acid-forming qualities of some ordinary fertilizers are given in Table 8 of Bulletin 607.

Table 7 Analyses of non acid-forming fertilizer.

Laboratory Number	Name of Brand	Claim to be non acid-forming	Acid-Base Balance

Relation to Experiment Station Work

The work of the State Chemist is closely related to the chemical work of the Experiment Station. In his capacity as Chief of the Division of Chemistry of the Experiment Station, the State Chemist is carrying out extensive investigations into the fundamental properties of soils, especially with respect to their content of plant food. This work is related closely to the use of fertilizers and is connected with investigations as to the agricultural value of fertilizers required of the Fertilizer Control, for fertilizers vary in effect upon the different soils.

Soft Phosphate With Colloidal Clay and Phosphate Rock

Soft phosphate with colloidal clay is a natural phosphate of lime containing 20 per cent of total phosphoric acid or more. The phosphate of lime is so finely divided that some of it is termed colloidal. The availability to plants of the phosphoric acid of soft phosphate with colloidal clay is on an average about 40 per cent of that of the available phosphoric acid in 20 per cent superphosphate. Additional information is given in Bulletin 509.

Phosphate rock contains phosphoric acid as tri-calcium fluorophosphate and contains about 3 per cent of fluorine. When sufficiently pure, phosphate rock is used for the manufacture of superphosphate. The phosphoric acid in phosphate rock is taken up very slowly by the plants. There are very decided differences in the power of plants to take up phosphoric

acid from phosphate rock and its effect is different on different soils. The availability of the total phosphoric acid in rock phosphate to plants averages about one-fourth of the availability of phosphoric acid in superphosphate. Additional information is given in Bulletin 212.

Sulphur, Gypsum, Manganese, and Other Secondary Fertilizing Elements

Our present evidence indicates that manganese, magnesium, sulphur, calcium, boron, iodine, zinc or other secondary fertilizing elements are not needed as additions to Texas soils. Sulphur and calcium are present in large quantities in practically all mixed fertilizers except nitrate of soda, which is low in both, ammonium sulphate, which is low in calcium, and cyanamid, which is low in sulphur. Small quantities of the other elements are also present. The quantities of sulphur and calcium in some Texas fertilizers are given in Bulletin 593.

We are unable to recommend the use of sulphur or gypsum alone as a fertilizer to supply sulphur in Texas because Texas soils need nitrogen, phosphoric acid or potash much more than they need sulphur, and the sulphur or gypsum does not supply any of these plant foods. The experiments which have been carried out do not give results which justify the use of such materials alone as fertilizers (see Bulletins 408 and 414). This also applies to the natural mixture of sulphur, gypsum, sulphuric acid and other substances, which various parties and concerns have attempted to sell or exploit as a fertilizer or soil amendment. It is not recommended for use as a fertilizer and does not give results on soils which need fertilizer, as shown in Bulletins 408 and 414.

For plants which do best on an acid soil, sulphur is being used to acidify soils that are alkaline or neutral. The organisms in the soil oxidize the sulphur to sulphuric acid and this in turn acidifies the soil. The oxidation requires two or three months. The quantity to be used depends upon the buffer capacity of the soil for acid, and may range from a few hundred pounds to several thousand pounds per acre. In the latter case, acidification of spots is best. The value of a sulphur mixture for acidifying the soil depends on the quantity of sulphur present: a material containing 85 per cent of sulphur is $4\frac{1}{2}$ times as strong as one containing only 20 per cent of sulphur and one containing 99 per cent sulphur is 14 per cent stronger than one which contains 85 per cent.

On some limestone soils plants suffer from a yellowing of the leaves, known as chlorosis, usually due to deficiency of iron. The presence of carbonate of lime prevents the plant from taking up (or utilizing) sufficient iron. Most of these soils contain such large quantities of carbonate of lime that broadcast applications of sulphur are soon neutralized and made useless. A sufficient number of acidified spots may prevent the chlorosis. The acidified spots may be made by digging post holes to depths of 2 to 3 feet, mixing the dirt with sulphur and returning the mixture

to the holes. Holes may also be made with a pointed iron rod and filled with the sulphur. The sulphur may also be placed in furrows. A sulphur compost may also be used, as recommended by Godfrey in Progress Report No. 675.

Investigations on the use of manganese sulphate for Texas soils are given in Bulletin 432. The results of the experimental work do not justify recommendation of the use of manganese sulphate on Texas soils.

Sodium Fluorescein as a Fertilizer

Tablets of sodium fluorescein, under the trade name of "Hy-Gro" recently appeared for sale as a "liquid sunshine for all plants." Printing on the package claimed that "Hy-Gro accelerates plant growth by concentrating the sun's energy and promoting photosynthesis. Hy-Gro treated plants produce more abundantly and are healthier because they absorb more vital minerals than untreated plants." These claims brought the product under the fertilizer laws of Texas. Experiments were therefore run in the greenhouse in order to determine whether or not corn, periwinkles, and petunias responded to the addition of this material.

Corn, petunias, and periwinkles were grown in the usual greenhouse procedure, after fertilizing all pots with 6-12-6 commercial fertilizer. Six pots in each series received Hy-Gro applied in accordance with directions printed on the package, while six pots were untreated. Corn averaged 33.7 grams of dry matter per pot from treated pots and 33.4 grams from untreated pots. Periwinkles averaged 33 blooms and 12.1 grams of dry matter per pot from both treated and untreated pots. Petunias averaged 54 blooms and 7.7 grams of dry matter per pot from the treated pots and 53 blooms and 7.4 grams of dry matter per untreated pot. None of these differences are significant; results secured do not substantiate claims printed on the package. There are no chemicals known to science which would accelerate plant growth by concentrating the sun's energy and promoting photosynthesis (Reported by Dr. J. F. Fudge).

Root Stimulants as Related to Crop Production

Claims have been made that greater yields of cotton, corn and other crops can be secured by dusting the seed with a plant root stimulant such as levulinic acid or other such compounds.

While these compounds under some conditions may stimulate the growth of roots, and help to secure a better stand, under other conditions they have no effect or may even be injurious. Their use to increase the production of cotton or other crops cannot be recommended at the present time. Future investigations may possibly show that some of these chemicals under some conditions may be safely used with profitable results. Whether or not any of them can be profitably used, and which of these

chemicals can be used and under what conditions their use may be profitable must await the results of further investigation. They have been used to promote the growth of roots on cuttings. The kind of chemical used, the strength of the solution and the kind of cutting all affect the results. The subject is discussed in a book entitled *Plant Growth Substances, their chemistry and application with special reference to synthetics*, by Hugh Nichols, published by the Chemical Publishing Company in 1941.

Vitamin B₁

Vitamin B₁ (thiamin hydrochloride) is now an ingredient of some garden fertilizers and is sold alone in such a way as to bring it under the Texas fertilizer law.

Vitamin B₁ appears to promote the growth of roots and may be of advantage to some plants at the time they are transplanted. Vitamin B₁ does not and cannot take the place of mineral fertilizers essential to plant growth. If the soil does not contain sufficient plant food, fertilizers are needed whether vitamin B₁ is supplied or not.

All plants produce vitamin B₁ in their leaves and in their roots. Many plants, especially wheat, corn, tomatoes, peas, beans, etc., produce sufficient vitamin B₁ to supply all needs.

The application of vitamin B₁ in the growing of plants probably has a definite field of usefulness, but its use is still in the experimental stage. Those who wish to experiment with it should compare five or more plants to which it has been applied with five or more similar plants to which it has been applied growing under the same conditions. Unless some such comparison is made, it is not possible to tell whether or not the vitamin B₁ is effective. Recent experiments have shown that applications of vitamin B₁ have little effect on the growth or flowering of most plants. Further information is given in Circular 95.

Fertilizers for Water Culture

Soluble fertilizers, intended for use in water culture, are now being sold. Water culture is the growing of plants in a water solution that contains all the necessary elements for proper plant growth. There is nothing either new or miraculous about growing plants in water, as it has been done for a hundred years. What is new is the commercial application of water-culture methods.

The soil supplies plants with necessary elements, can be easily fertilized, and the soil helps to regulate the supply of plant food to the plant. The elements which must be added to the water in which the plants are to be grown include nitrogen, potassium, calcium, magnesium, sulphur, iron, manganese, boron, zinc and copper. The solution must have the proper acidity, which requires adjustment or renewal from time to time. The plants must be properly supported. Once the plants begin to grow, the questions of suitable quantities of light, correct temperature, heat, as

well as protecting from pests and diseases must be met. Keeping the solution well balanced in necessary elements is important and not always easy. All plants do not use the same quantities of the elements, consequently as one is absorbed so freely by certain plants a deficiency of it in the solution may result.

Commercial growing plants in water culture is in the experimental stage. For some crops the method is entirely too expensive, for other crops, the yield will be just as large when grown in soil. For anyone who wishes to experiment with water culture, there are several books describing the technique in detail, these can be purchased from a good bookstore.

INFORMATION CONCERNING THE USE OF FERTILIZER

Information concerning the use of commercial fertilizer for various crops in different sections of Texas will be sent free on request. Some publications of the Texas Experiment Station giving information on fertilizers and fertilizing material are as follows:

- Circular 85—Use of commercial fertilizers.
- Bulletin 167—Commercial fertilizers and their use.
- Bulletin 212—The availability of phosphoric acid in rock phosphate.
- Bulletin 350—Fertilizer statistics for Texas (to 1927).
- Bulletin 398—Fertilizers for rice in Texas.
- Bulletin 414—Possibilities of sulphur as a soil amendment.
- Bulletin 428—The fertilizing value of greensand.
- Bulletin 432—Manganese in Texas soils and its relation to crops.
- Bulletin 445—The composition and fertilizing value of sewage sludge.
- Bulletin 469—Fertilizer experiments with cotton.
- Bulletin 509—Availability of the phosphoric acid of finely divided rock phosphate.
- Bulletin 524—Fertilizer experiments with yellow Bermuda onions in the Winter Garden region of Texas.
- Bulletin 572—Fertilizer statistics for Texas, 1926-38.
- Progress report 594—Non-acid forming fertilizers.
- Bulletin 596—Onion fertilizer experiments at Laredo, Big Well, and Eagle Pass, Texas.
- Bulletin 602—Fertilizers for rice in Texas.
- Progress report 675—Acid production in compost of sulphur and organic matter.
- Circular 90—Rose growing for the home gardener.
- Circular 95—Vitamin B₁ (Thiamin) and other vitamins as fertilizers.

Any of these publications will be sent free on request to the Director of the Experiment Station, College Station, Texas. In order to avoid errors, both the name and the number should be given.

SUMMARY

This Bulletin contains a report of the Texas Fertilizer Control for 1941-42.

An explanation of terms is given.

Sales of fertilizer in Texas were 134,560 tons in 1941-42. They were 129,578 tons in 1940-41. The tonnage for other years is given. The tons reported do not include cottonseed meal sold as a feed but used as a fertilizer.

The average selling prices and composition of the different kinds of fertilizer are given.

Available phosphoric acid costs less in 20 per cent superphosphate than in 18 per cent.

The grades of fertilizer to be sold next season are given.

A table is given showing the relation of the guaranteed valuation to the valuation delivered by the various manufacturers.

Analyses of 1,185 samples collected by the inspector are given.
