

# Particulate Matter

## What Is It and Why Does it Matter to Agriculture?

Russell McGee and Saqib Mukhtar\*

**Particulate matter (PM)** is the term applied to dust and other small particles that are suspended in the air. The Environmental Protection Agency (EPA) regulates PM as a pollutant because it can cause health problems when inhaled. There are two categories of PM—coarse and fine.

**Coarse PM**, typically found near roadways and dusty industries, is made up of particles larger than 2.5 micrometers and smaller than 10 micrometers in diameter.

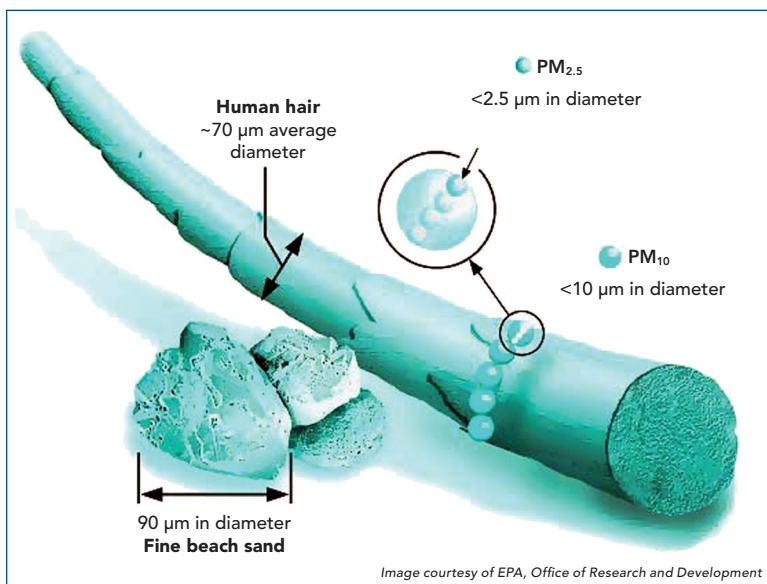

**Cotton gins, grain elevators, feed mills, feedlots and many other agricultural operations have been subject to EPA regulations for years. As environmental regulations become more stringent, field operations such as tillage may be subject to regulations as well.**

**Fine PM**, found in smoke and haze, is made up of particles 2.5 micrometers in diameter and smaller. These particles are emitted from sources such as combustion. They can also form when gases emitted from power plants, industries and automobiles react in the air.

The EPA has established a National Ambient Air Quality Standard for PM and other pollutants. As the EPA and state regulatory agencies refine their regulations, it is important to recognize that not all PM is the same. Most of the PM in urban environments is fine, while most agricultural PM is larger than the coarse classification. In urban areas most particulates come from combustion or are emitted from smokestacks and automobiles. These finer particles are considered a much greater health risk than larger particles. Particulates from agriculture contain a much higher percentage of soil particles, which are usually more than 20 microns in diameter and do not pose a health risk.

The current National Ambient Air Quality Standard limits the concentration of coarse PM particles in emissions to 150  $\mu\text{g}/\text{m}^3$  and the concentration of fine PM particles to 35  $\mu\text{g}/\text{m}^3$ . EPA is proposing to introduce a new standard for coarse PM. The proposed concentration limit is 75  $\mu\text{g}/\text{m}^3$  on a 24-hour-average basis.

Particulate matter is classified in terms of diameter. Here, the diameter of particulate matter is compared to the width of a human hair.
