#### **EXECUTIVE SUMMARY**

The Energy Systems Laboratory was requested to develop cost-effective recommendations to maximize energy savings for residential and commercial buildings in the City of Arlington (CoA). This report presents the analysis results for small retail buildings in the CoA.

For more realistic recommendations, the CoA provided two years of commercial building energy compliance reports from 2008 to 2010 which exceeded the energy efficiency requirements of the CoA (i.e., ASHRAE 90.1-2001). From a statistical analysis of energy compliance reports provided for eleven commercial, above-code approaches that had been made in the CoA were summarized for commercial applications<sup>1</sup>. Based on a summary of above-code approaches, recommendations were developed to achieve above-code energy performance based on the ASHRAE 90.1-2001 and 2007 standard reference buildings, for small retail buildings in the CoA

The deliverables for the CoA in this report are:

• Recommendations of 16 energy efficiency measures (EEMs) to maximize energy savings for small retail buildings in the CoA with estimated cost of the improvement, simple payback calculations, and emissions savings.

A total of 16 recommendations based on the energy savings above the base-case building were selected. These measures include building envelope and fenestration, HVAC system, service hot water (SHW) system, lighting, and renewable options. The implementation costs of each individual measure were also calculated along with simple payback calculations. Figures 1 and 2 present a description of the individual measures and combinations of these measures which achieve 15% source energy savings above the ASHRAE 90.1-2001 and 2007 code-compliant building. Annual energy savings, estimated costs, simple payback, and NOx, SO<sub>2</sub>, and CO<sub>2</sub> emissions reduction are provided.

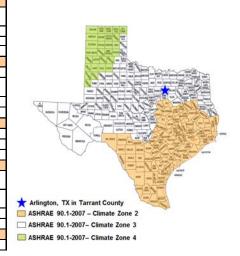

-

<sup>&</sup>lt;sup>1</sup> The results of the review are presented in Kim et al. (2011).

#### 1 INTRODUCTION

The Energy Systems Laboratory was requested to develop cost-effective recommendations to maximize energy savings for residential and commercial buildings in the City of Arlington (CoA). This report presents the analysis results for small retail buildings in the CoA.

For more realistic recommendations, the CoA provided two years of commercial building energy compliance reports from 2008 to 2010 which exceeded the energy efficiency requirements of the CoA (i.e., ASHRAE 90.1-2001). From a statistical analysis of energy compliance reports provided for eleven commercial, above-code approaches that had been made in the CoA were summarized for commercial applications<sup>2</sup>. Based on a summary of above-code approaches, recommendations were developed to achieve above-code energy performance based on the ASHRAE 90.1-2001 and 2007 standard reference buildings, for small retail buildings in the CoA

The deliverables for the CoA in this report are:

• Recommendations of 16 energy efficiency measures (EEMs) to maximize energy savings for small retail buildings in the CoA with estimated cost of the improvement, simple payback calculations, and emissions savings.

## 1.1 Organization of the Report

The report is organized in the following order:

- Section 1 presents the introduction and purpose of the report.
- Section 2 presents the methodology that was used.
- Section 3 presents the proposed energy efficiency measures for small retail buildings in the CoA, including savings from 16 individual measures along with the simple payback calculations.
- Section 4 is a summary which is followed by references.

-

<sup>&</sup>lt;sup>2</sup> The results of the review are presented in Kim et al. (2011).

#### 2 METHODOLOGY

This section describes the methodology and assumptions that were used in this analysis: to develop the cost-effective recommendations for achieving energy performance better than ASHRAE 90.1-2001 and 2007 code-compliant buildings for small retails in the CoA. Section 2.1 presents the overall approach used in this analysis. Section 2.2 describes the base-case building characteristics. Section 2.3 presents assumptions used in cost analysis.

#### 2.1 Overview

Based on the summary of commercial above-code approaches (Kim et al. 2011), recommendations were developed to achieve above-code energy performance based on the ASHRAE 90.1-2001 and 2007 standard reference building, for small retails in the CoA. The analysis was performed using the eQuest 3.64 simulation software (JJH. 2009) based on the DOE-2.2 simulation of ASHRAE 90.1-2001 and 2007 code-compliant, small retail buildings for Tarrant County where the CoA is located and the Fort Worth TMY2 weather file (Figure 5). A total of 16 energy efficiency measures were then applied to the base-case models to determine the savings of each measure. These measures were simulated by modifying the selected parameters used for the DOE-2 simulation tool. The solar measures including solar PV and solar SHW were simulated using the PV-F Chart (Klein and Beckman 1994) and F-Chart (Klein and Beckman 1983) programs, respectively. The implementation costs of each measure were also calculated along with simple payback calculations.

The measures were then combined to achieve the total source energy savings of the group which is 15% above the base-case ASHRAE 90.1-2001 and 2007 code-compliant buildings. The results from individual measures and cost analysis were used to guide the selection of measures. As a result, four combinations were proposed for each base case. Each combination was formed to have a different payback period. Finally, the corresponding emissions savings of each combination were calculated based on the eGrid for Texas.

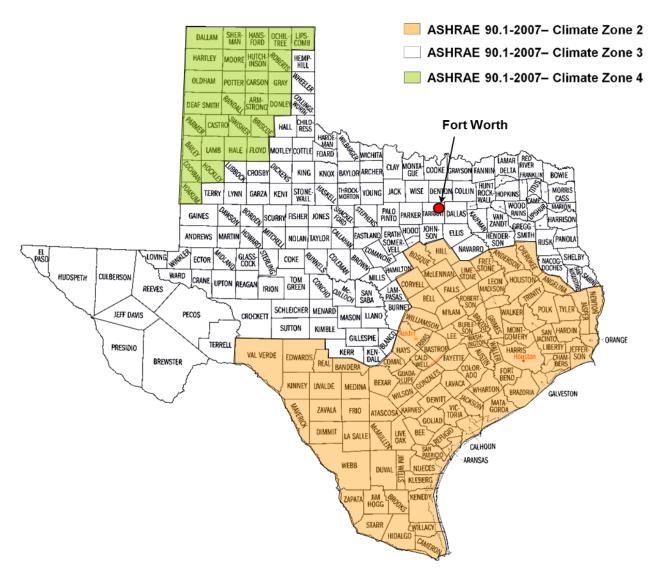

Figure 3. Tarrant County and Fort Worth TMY2 Weather File Used in the Analysis

## 2.2 Base-Case Building Description

The base-case building simulation model in this analysis is based on the *standard* design as defined in the ASHRAE 90.1-2001<sup>3</sup> and 2007<sup>4</sup> and certain assumptions, which are described throughout this document. The base-case building is a 15,000 sq. ft., one story, structural mass concrete strip mall oriented south with a 70% window-to-wall ratio for front wall only<sup>5</sup>. The overall dimensions of the building were set at 245 ft wide by 61 ft deep with a floor-to-ceiling height of 17 feet, consisting of eight stores (Figure 4). Each store was zoned as a single zone. The other envelope and system characteristics were determined from the general characteristics and the climate-specific characteristics as specified in the ASHRAE 90.1-2001 and 2007. Table 1 summarizes the base-case, ASHRAE 90.1-2001 and 2007 code-compliance building characteristics used in the DOE-2 simulation tool in this analysis.

## 2.3 Assumptions for Cost Analysis

The cost analysis for different measures was carried out based on utility costs of \$0.095/kWh for electricity, \$5.00/kW for demand charge, and \$0.65/therm for natural gas. The electricity rate was determined based on the annual average prices of Texas commercial electricity for 2010 published by the U.S. DOE EIA (2011), and demand charges were from the previous study by Cho et al. (2007). For natural gas rates, the annual average rates calculated for Arlington were used (Atmos Energy 2011).

<sup>&</sup>lt;sup>3</sup> per 2003 IECC Section 801.2

<sup>&</sup>lt;sup>4</sup> per 2009 IECC Section 501.2

<sup>&</sup>lt;sup>5</sup>28% window-to-wall ratio for an entire building

#### 3 PROPOSED ENERGY EFFICIENCY MEASURES FOR SMALL RETAIL BUILDINGS

This section documents 16 energy efficiency measures (EEMs) for small retail buildings to achieve above-code energy performance based on the ASHRAE 90.1-2001 and 2007 code-compliant small retail building in Tarrant County, Texas, where the CoA is located. Section 3.1 gives a brief description of 16 individual EEMs and provides input parameters used in the simulation of each EEM. Section 3.2 presents the results of simulation and cost analysis.

#### 3.1 **Individual EEMs**

Table 2 lists energy efficiency measures considered in this analysis. These include measures for the building envelope and fenestration, HVAC system, service hot water (SHW) system, lighting, and renewable options. These measures were simulated by modifying the selected parameters used for the DOE-2 simulation tool. Tables 3 and 4 show the details on the simulation input parameters.

Table 2. Energy Efficiency Measures

	EEM								
	No.	EEM Description							
	1	Increased Roof and Wall Insulation R-Value (ASHRAE 90.1-2001: from 15 to 25 for roof and 0 c.i. to 11.4 c.i. for walls; and ASHRAE 90.1-2007: from 20 to 25 for roof and 7.6 c.i. to 11.4 c.i. for walls)							
Envelope and Fenestration	2	Decreased Glazing U-Value (ASHRAE 90.1-2001: from 1.22 to 0.35; and ASHRAE 90.1-2007: from 0.6 for window & 0.9 for door to 0.35)							
Measures	3	0.5 PF Window Shading (None to 6.75 ft. Overhang)							
	4	High Albedo Roof for ASHRAE 90.1-2001 (Roof Absorptance from 0.7 to 0.3)							
	5	CO <sub>2</sub> -Based Demand-Controlled Ventilation (DCV)							
HVAC System	6	Improved Air Conditioner Efficiency (from 13 SEER & 11 EER to 18 SEER & 13.5 EER)							
Measures	7	Improved Furnace Efficiency (from 80% to 90% Et)							
	8	Improved Fan Efficiency (from 55% to 65%)							
	9	Improved SHW Heater Efficiency (from 0.59 EF to 0.86 EF)							
Service Hot Water Measures	10	Tankless Gas Water Heater							
	11	Solar Service Hot Water System (64 sq.ft. collector, 80 gal tank)							
	12	Decreased Lighting Power Density based on ASHRAE 90.1-2010 (ASHRAE 90.1-2001: from 1.9 to 1.4 W/sq.ft.; and ASHRAE 90.1-2007: from 1.5 to 1.4 W/sq.ft.)							
Limbing Managemen	13	Decreased Lighting Power Density based on AEDG-SR-2006 (ASHRAE 90.1-2001: from 1.9 to 1.25 W/sq.ft.; and ASHRAE 90.1-2007: from 1.5 to 1.25 W/sq.ft.)							
Lighting Measures	14	Daylight Dimming Control							
	15	Sky light (3% Skylight-roof-ratio, U-0.34 & 0.19 SHGC) with Dimming Control							
Renewable Power Measure	16	28 kW Photovoltaic Array

### 3.2 Results of Simulation and Cost Analysis

### 3.2.1 Base-Case Energy Use

The annual total energy consumption of the ASHRAE 90.1-2001 base case:

- a) Site energy use by end-uses: 993.1 MMBtu/yr, including
  - 18.1% for cooling;
  - 24.8% for heating;
  - 41.6% for lighting and equipment;
  - 12.5% for fans and pumps; and
  - 2.9% for service water heating.
- b) Source energy use by fuel type: 2,270 MMBtu/yr, including
  - 88.2% for electricity; and
  - 11.8% for natural gas.

The annual total energy consumption of the ASHRAE 90.1-2007 base case:

- a) Site energy use by end-uses: 812.9 MMBtu/yr, including
  - 20.6% for cooling;
  - 19.0% for heating;
  - 42.0% for lighting and equipment;
  - 14.8% for fans and pumps; and
  - 3.5% for service water heating.
- b) Source energy use by fuel type: 1,989 MMBtu/yr, including
  - 90.8% for electricity; and
  - 9.2% for natural gas.

These results suggest that the measures that reduce the lighting and equipment energy use would have the highest impact on the total energy use for small retail buildings in the CoA. Since the above-code performance is determined based on source energy consumption, the measures reducing electricity consumption will yield higher savings percentage than the measures decreasing natural gas consumption.

### 3.2.2 Energy Savings from Various Individual EEMs

Tables 5 and 6 summarize the savings achieved from proposed EEMs and cost analysis for the ASHRAE 90.1-2001 and 2007 code-compliant small retail buildings, including:

- Annual site energy consumption for different end-uses and total;
- Annual source energy consumption for different fuel types;
- Above-code savings (%) for site and source and \$ savings;
- Increased cost of implementation (obtained from various resources listed in Appendix A); and
- Simple payback period for each measure.

The annual site energy use was obtained from the BEPS report of the DOE-2 output and then converted to source energy<sup>6</sup>. Figures 5-10 provide a graphical representation of the site/source energy consumption of the individual EEMs for the ASHRAE 90.1-2001 and 2007 code-compliant base-case small retail building.

<sup>&</sup>lt;sup>6</sup> The source energy multipliers used in this analysis were 3.16 for electricity and 1.1 for natural gas based on Section 405.3 of the 2009 IECC.

#### The savings results are:

- a) Increased Roof and Wall Insulation R-Value:
  - ASHRAE 90.1-2001: 13.8% (site energy savings) and 6.6% (source energy savings) and
  - ASHRAE 90.1-2007: 1.2% (site energy savings) and 0.5% (source energy savings).
- b) Decreased Glazing U-Value:
  - ASHRAE 90.1-2001: 5.5% (site energy savings) and 2.0% (source energy savings) and
  - ASHRAE 90.1-2007: 3.1% (site energy savings) and 1.0% (source energy savings).
- c) 0.5 PF Window Shading:
  - ASHRAE 90.1-2001: -0.9% (site energy savings) and 0.5% (source energy savings) and
  - ASHRAE 90.1-2007: -1.0% (site energy savings) and 0.7% (source energy savings).
- d) High Albedo Roof:
  - ASHRAE 90.1-2001: -0.1% (site energy savings) and 0.8% (source energy savings).
- e) CO<sub>2</sub>-Based Demand-Controlled Ventilation:
  - ASHRAE 90.1-2001: 6.2% (site energy savings) and 3.5% (source energy savings) and
  - ASHRAE 90.1-2007: 6.3% (site energy savings) and 3.5% (source energy savings).
- f) Improved Air Conditioner Efficiency:
  - ASHRAE 90.1-2001: 3.8% (site energy savings) and 4.7% (source energy savings) and
  - ASHRAE 90.1-2007: 4.4% (site energy savings) and 5.1% (source energy savings).
- g) Improved Furnace Efficiency:
  - ASHRAE 90.1-2001: 2.7% (site energy savings) and 1.2% (source energy savings) and
  - ASHRAE 90.1-2007: 2.1% (site energy savings) and 0.9% (source energy savings).
- h) Improved Fan Efficiency:
  - ASHRAE 90.1-2001: 1.5% (site energy savings) and 2.4% (source energy savings) and
  - ASHRAE 90.1-2007: 1.8% (site energy savings) and 2.8% (source energy savings).
- i) Improved SHW Heater Efficiency:
  - ASHRAE 90.1-2001: 0.9% (site energy savings) and 0.4% (source energy savings) and
  - ASHRAE 90.1-2007: 1.1% (site energy savings) and 0.4% (source energy savings).
- j) Tankless Gas Water Heater:
  - ASHRAE 90.1-2001: 0.8% (site energy savings) and 0.3% (source energy savings) and
  - ASHRAE 90.1-2007: 1.0% (site energy savings) and 0.4% (source energy savings).
- k) Solar SHW System (64 sq. ft. collector, 80 gal tank):
  - ASHRAE 90.1-2001: 2.3% (site energy savings) and 1.0% (source energy savings) and
  - ASHRAE 90.1-2007: 2.9% (site energy savings) and 1.2% (source energy savings).
- 1) Decreased Lighting Power Density to 1.4 W/sq.ft.:
  - ASHRAE 90.1-2001: 7.8% (site energy savings) and 11.5% (source energy savings) and
  - ASHRAE 90.1-2007: 2.0% (site energy savings) and 2.8% (source energy savings).

- m) Decreased Lighting Power Density to 1.25 W/sq.ft.:
  - ASHRAE 90.1-2001: 10.0% (site energy savings) and 14.9% (source energy savings) and
  - ASHRAE 90.1-2007: 4.8% (site energy savings) and 6.9% (source energy savings).
- n) Daylight Dimming Control:
  - ASHRAE 90.1-2001: 7.5% (site energy savings) and 10.8% (source energy savings) and
  - ASHRAE 90.1-2007: 7.4% (site energy savings) and 10.1% (source energy savings).
- o) Skylight (3% SRR, U-0.34 and 0.19 SHGC) with Dimming Control:
  - ASHRAE 90.1-2001: 16.2% (site energy savings) and 23.9% (source energy savings) and
  - ASHRAE 90.1-2007: 15.3% (site energy savings) and 21.9% (source energy savings).
- p) 28 kW Photovoltaic Array:
  - ASHRAE 90.1-2001: 15.3% (site energy savings) and 18.7% (source energy savings) and
  - ASHRAE 90.1-2007: 18.7% (site energy savings) and 21.9% (source energy savings).

Of the 16 measures for both ASHRAE 90.1-2001 and 2007 code-compliant buildings, solar PV and skylight measures present the most savings: 18.7% to 23.9% source energy savings. A daylight dimming control measure also shows a high source energy savings for both base cases (10.8% and 10.1%), while a decreased lighting power density measure yields much higher savings for an ASHRAE 90.1-2001 base case compared to an ASHRAE 90.1-2007 base-case building. Among the envelope and fenestration measures, increased roof and wall insulation and decreased glazing u-value measures result in a high site energy savings for an ASHRAE 90.1-2001 base case: 13.8% (EEM1) and 5.5% (EEM 2), but the source energy savings becomes lower due to a high savings in natural gas. Among the HVAC system measures, an improved air conditioner efficiency measure results in a high source energy savings: 4.7% and 5.1%. Two other measures, such as CO<sub>2</sub>-based demand-controlled ventilation and improved fan efficiency, yield 2.4% to 3.5% source energy savings. In service hot water measures, all three measures result in low savings: 0.3% to 1.2% source energy savings.

### 3.2.3 Cost Effectiveness of Various Individual EEMs

It should be noted that, due to the difference in the unit cost of electricity and gas, the energy cost savings for a measure will not always coincide with the energy savings. These savings depend on the fuel type associated with the end use affected from that measure. Because of this, measures that reduce electricity use for space cooling or lighting and equipment resulted in significant energy cost savings compared to the measures that reduce only gas use.

The solar PV and lighting measures that show a significant reduction in electricity use are very effective in reducing the overall energy cost. The measures that reduce electricity use for cooling and fans and pumps also result in high energy cost savings. These measures include improved air conditioner efficiency and improved fan efficiency. A CO<sub>2</sub> based demand-controlled ventilation measure also yields a relatively high cost savings. An increased roof and wall insulation measure is effective only for an ASHRAE 90.1-2001 base case.

To estimate the cost-effectiveness of measures, the implementation costs of each measure (obtained from various resources listed in Appendix B), were surveyed along with simple payback calculations. The cost-effectiveness of a measure depends upon the energy cost savings versus the cost of implementation. Decreased lighting power density measures (EEM 12 and 13) are the most cost-effective with the shortest

payback periods of 1.9 to 3.0 years for both base cases. Another lighting measure, daylight dimming control (EEM 14) yields a short payback also: 5.2 to 7.8 years (ASHRAE 90.1-2001 base case) and 6.5 to 9.8 years (ASHRAE 90.1-2007 base case). Improved fan efficiency (EEM 8) and improved A/C efficiency (EEM 6) measures also yield relatively short payback periods: 8.7 to 13.1 years (ASHRAE 90.1-2001 base case) and 8.9 to 13.3 years (ASHRAE 90.1-2007 base case) for EEM 8; and 7.2 to 10.9 years (ASHRAE 90.1-2001 base case) and 7.8 to 11.7 years (ASHRAE 90.1-2007 base case) for EEM 6.

#### 3.2.4 Combined EEMs

Grouped measures are the combination of individual measures. The results from individual measures and cost analysis were used to guide the selection of measures for this group analysis. The measures were combined to achieve the total source energy savings<sup>7</sup> of the group that is 15% above the base-case simulation of each ASHRAE 90.1-2001 and 2007 code-compliant small retail building. Because the measures are interdependent in many cases, the resultant savings of grouped measures are not always the same as the sum of the savings of the individual measures. In a similar fashion as the analysis of the individual measures, the group measures were simulated by modifying all the parameters of combined individual measures.

As shown in Figures 32 and 33, four group measures were proposed for each base case. In each figure, the first table summarizes the results obtained from individual measures in terms of annual site energy savings, annual source energy savings, annual demand savings, energy cost savings, estimated costs for each measure implemented individually, and payback period. The second table summarizes the results obtained by implementing combined measures to achieve 15% or more total source energy savings, and includes: energy savings, energy cost savings, estimated costs, payback period for each combination, and annual NOx, SO<sub>2</sub>, and CO<sub>2</sub> emission savings.

The example groups represent one way of grouping to achieve 15% savings above the base case. In this analysis, each combination was intended to have a different payback period. The most cost-effective combination (combination 1) has a payback period of:

- a) ASHRAE 90.1-2001: 3.6 to 5.5 years and
- b) ASHRAE 90.1-2007: 5.2 to 7.8 years.

A payback period of the least cost-effective combination (combination 3) is:

- a) ASHRAE 90.1-2001: 8.5 to 12.7 years and
- b) ASHRAE 90.1-2007: 10.8 to 16.2 years.

7

<sup>&</sup>lt;sup>7</sup> The estimated total source energy savings include heating, cooling, lighting, equipment, and SHW for emissions reductions determination.

#### Note

- 1. Total energy savings from heating, cooling, lighting, equipment and DHW for emissions reductions determination.
- Savings depend on fuel mix used.
  - \* Energy Cost: Electricity = \$0.095/kWh & Demand = \$5.00/kW Natural gas = \$0.65/therm
- 3. Yearly demand cost = Sum of monthly demand cost for 12 months
- 4. Marginal cost = new system cost original system cost
- 5. New system cost = new system cost only
- 6. See individual measures above for specific savings

[ASHRAE 90.1-2001 Code-Compliant Retail Building Description]

- \* Building type: Small Retail (Strip Mall Type)
- \* Gross area: 15,000 sq-ft
- \* Building dimension: 61 ft x 245 ft x 17 ft (WxLxH)
- \* Number of floors: 1
- \* Floor-to-floor height: 17 ft
- \* Window -to-w all ratio: 70% for Front Wall Only (28% for an Entire Building)
- \* HVAC system: SEER 13 or EER 11 Rooftop PSZ & 80% Et Furnace
- \* DHW: 0.59 EF Gas Water heater

Figure 10. Individual and Combined Energy Efficiency Measures for an ASHRAE 90.1-2007 Code-Compliant Small Retail Building for the CoA

#### 4 SUMMARY

This report presents cost-effective recommendations to maximize energy savings for small retail buildings in the City of Arlington (CoA). Based on a summary of above-code approaches, recommendations were developed to achieve above-code energy performance based on the ASHRAE 90.1-2001 and 2007 standard reference buildings, for small retail buildings in the CoA.

A total of 16 recommendations based on the energy savings above the base-case small retail building were selected. These measures include building envelope and fenestration, HVAC system, service hot water (SHW) system, lighting, and renewable options. The implementation costs of each individual measure were also calculated along with simple payback calculations. These measures were then combined to achieve the total source energy savings of the group is 15% above the base-case, ASHRAE 90.1-2001 and 2007 code-compliant small retail buildings. As a result, four combinations were proposed for each base case. Each combination was formed to have a different payback period. Finally, the corresponding emissions savings (NOx, SO<sub>2</sub>, and CO<sub>2</sub>) of each combination were calculated based on the eGrid for Texas.
