Chemical Weed and Brush Control Suggestions for Rangeland

Allan McGinty, J. F. Cadenhead, Wayne Hamilton, Wayne C. Hanselka, Darrell N. Ueckert and Steven G. Whisenant*

This publication is intended to provide general suggestions for herbicide use to control brush and weeds on Texas rangelands and information on the levels of control expected. The information is presented in good faith, but no warranty, express or implied, is given. Weed and brush control results may vary tremendously if treatments are applied under less than optimum conditions.

Users of this publication may find the "Expert System for Brush and Weed Control Technology Selection" (EXSEL)

helpful. EXSEL is a decision support expert system designed to recommend the best mechanical and chemical range brush and weed control treatments in Texas. It also provides an analysis of prescription fire potential and will produce a preburn checklist. The user may select the desired plant-kill efficacy level, force the system to consider certain types of treatments, or let the system choose the best alternative. EXSEL is on the World Wide Web (http://cnrit.tamu.edu/rsg/exsel) and can be accessed free of charge.

Tommy Welch, former Associate Department Head; Professor and Extension Program Leader for Rangeland Ecology and Management was the original author of this publication. After his retirement in 1995, the Herbicide Use Committee, Rangeland Ecology and Management (members listed above), assumed the responsibility for updating and maintaining this publication.

^{*}Professor and Extension Range Specialist; Assistant Professor and Extension Range and Brush Control Specialist; Senior Lecturer, Rangeland Ecology and Management; Associate Department Head, Professor and Extension Program Leader; Professor, Texas Agricultural Experiment Station; and Professor, Rangeland Ecology and Management; The Texas A&M University System.

Index

Control descriptions for weed and brush plants are located on the page numbers indicated. Carefully check the chart. More than one control measure may exist.

Weed species	Page
Berlandier lobelia	6
Bitter sneezeweed	
Broomweed (annual or common)	
Broom snakeweed	
Buffalobur	6
Bullnettle	8

Yaupon	13, 1
Yucca	2

able water for growth, reduce grass production and result in soil erosion. These noxious plants must be managed effectively for rangelands to reach their productive potential. Use of herbicides provides an effective and efficient alternative for controlling brush and weeds for improvement and maintenance of rangelands in a highly productive condition.

This publication lists current suggestions for herbicide use to control brush and weeds on rangeland. Some herbicides provide a high degree of control of certain species; however, seldom is a species eradicated. Consider other potential rangeland uses when developing a brush management program. Many trees, shrubs and forbs are valuable as food and cover for wildlife and may be an important component in livestock diets. Therefore, a brush management program should provide for use of control methods that give optimum benefits to livestock and wildlife.

Herbicide application may increase palatability of poisonous plants. Thus, they are more likely to be consumed by livestock. To prevent losses to toxic plants, herbicide-treated areas with poisonous plants present should not be grazed until the toxic plants dry up and lose their palatability.

Properly used herbicides are effective and safe. Misuse can result in poor brush and weed control and possible hazards associated with herbicidal drift or residues such as killing of desirable plants. Listed below are points to follow for proper herbicide use:

- Identify the weed or brush species and evaluate the need for control.
- Consider expected benefits, costs and alternative control practices.
- Select and purchase the suggested herbicide for the weed or brush species.
- Provide and require the use of proper safety equipment.
- Calibrate spray equipment.
- Mix herbicides in a ventilated area, preferably outside.
- Spray under conditions that minimize drift to susceptible crops.
- Apply the herbicides at the suggested rate and time.
- Keep a record of the herbicide used, the time required to spray, weather conditions, rate of herbicide in carrier, date and location and the person using the herbicide.

The sprayer used must apply the correct quantity of herbicide me to a specific area. To calibrate spray equipment, see Extension publication B-1648, "Private Applicator General Manual." For information on mixing herbicides, see L-1839, "Mixing Instructions for Liquid Herbicides."

Suggestions on use of herbicides made by the Texas Agricultural Extension Service are based upon effectiveness under Texas conditions.

Broadcast and individual plant treatments are presented in Table 1 and Table 2. Individual plant treatments are suited for control of thin stands of brush and selective control. Broadcast treatments are useful for dense stands of brush and for weed control.

Suggested herbicides must be registered and labeled for use by the Environmental Protection Agency. Because the status of herbicide label clearance is subject to change, be certain that the herbicide is currently labeled for the intended use.

The user is always responsible for the effects of herbicide residue on his livestock and crops, as well as for problems that could arise from drift or movement of the herbicide from his property to that of others. Always read and follow carefully the instructions on the container label.

Treatment Control Ratings

A control rating, based on the effectiveness of a herbicide treatment in controlling a target plant, has been given to each herbicide use suggestion. These ratings were determined from research and result demonstration data and from observations of commercial applications. The rating represents a degree of plant mortality of the target plant species when the treatment is properly applied under optimum conditions. The rating categories and degree of plant mortality are:

Percent of plants killed
76-100
56-75
36-55
0-35

	Common, Chemical and Product Names of	Herbicides*		
erbicide common name	Chemical name	Product name	Active ingredient or acid equivalent	
Clopyralid	3,6-dichloro-2-pyridinecarboxylic acid Reclaim		3 lbs./gal.

Tebuthiuron	N-[5-(1,1-dimethylethyl)-1,3,4-thiadiazol-2-yl]-N,N'-dimethylurea	Spike 20P	20%	
Triclopyr	[(3,5,6-trichloro-2-pyridinyl)oxy]acetic acid	Remedy	4 lbs./gal.	
Triclopyr:2,4-D(1:2)	See triclopyr and 2,4-D	Crossbow	3 lbs./gal.	

^{*}Herbicides have been identified by the accepted Weed Science Society of America common name, other common designation, the correct names required on the label, and when practical, one or more product names. For herbicides marketed under three or more labels, the designation "several manufacturers" has been used rather than attempting to list all the trade formulations.

	Liquid	Weight

^{*}Example: To prepare 3 gallons of a spray mixture (herbicide, water and surfactant) containing 1% herbicide, add 4 oz. of herbicide.

Note: Add 1/4% to 1/2% commercial, non-ionic surfactant for mixtures using only water as the herbicide carrier.

Add 5% diesel fuel if an oil-in-water emulsion is desired to be the herbicide carrier. An oil emulsifying agent (emulsifier) should be added according to label directions. Agitation and the emulsifier are necessary to prevent separation of the spray mixture.

Caution:

Non-ionic surfactants are **not** emulsifying agents and will **not** result in the formation of an emulsion when diesel fuel and water are mixed and agitated. The emulsifier should be added at I to 3 ounces per gallon of the diesel fuel prior to adding the diesel fuel to the spray tank. The spray tank should be filled to about half the desired volume with water prior to adding the diesel fuel-emulsifier premix. The diesel fuel-emulsifier premix is then added to the spray tank slowly, with agitation, after which the spray tank is filled to the desired volume with water.

Pricklypear (continued)	Prescribed burn + Tordon 22K	VH** I/2 pt. (I/8 lb.) to I pt. (I/4 lb.) (see remarks)			After burn, before April 30 (May 31 if new pads do not develop by April 30).	Carry out prescribed burn between December and March. Sufficient fine fuel with good fuel continuity should be present to provide a uniform burn with moderate to high intensity. Spray the burned area within 5 months of the burn but no later than April 30 (May 31 if new pads do not develop by April 30). Use 1/2 pt. Tordon 22K when the prescribed burn is sufficiently intense to brown-out most pricklypear pads with less than 10 percent of the pricklypear green 2 weeks after the burn. Use 1 pt. Tordon 22K following moderate intensity burn with more than 10 percent of the pricklypear green 2 weeks after the burn. The prescribed burn plus Tordon 22K treatment is not recommended for the Rio Grande Plains land resource area.
Redberry juniper (redberry cedar)	Velpar L (plants less than 6 ft. tall) Velpar L (plants more than 6 ft. tall)		VH 2 ml. per 3 ft. of height or canopy diameter (whichever is greater) H 4 mi. per 3 ft. of height or canopy diameter (whichever is greater)		Late winter through summer.	Apply undiluted Velpar L to soil surface between the stem base and edge of canopy. Use an exact delivery handgun applicator to apply the 2 ml. dose. If plant size requires more than a single 2 mi. application, space subsequent applications equally around the plant. Do not use on marshy or poorly drained sites nor on soils classified as clays.
	Tordon 22K		VH 4 mi. per 3 ft of height or canopy diameter (whichever is greater)		Spring through fall, before expected rainfall.	Apply undiluted Tordon 22K to the stem base at or near the ground line. Use an exact delivery handgun applicator to apply the 4 ml. dose. If plant size requires more than a single 4 ml. application, space subsequent applications equally around the plant. Do not use on marshy or poorly drained sites nor on soils classified as clays.
Redberry juniper (cut stumps)	Tordon 22K		VH 4% in water	Spray the sides of the stump and the cut surface, including the cambium, immediately after cutting, to thoroughly wet the stem and root collar area, but not to the point of runoff.	Any season of the year, except when snow or water prevent spraying to the ground line.	This is commonly called the cut stump application method. Apply with a backpack or knapsack sprayer using low pressures and a solid cone or flat fan nozzle. Add 1 to 2 qts. surfactant per 100 gals. of water.
