**TEXAS A&M ENGINEERING
EXPERIMENT STATION**

Energy Systems Laboratory

November 25, 2013

Chairman Bryan W. Shaw, Ph.D.
Texas Council on Environmental Quality
P. O. Box 13087
Austin, TX 78711-3087

Dear Chairman Shaw:

The Energy Systems Laboratory (ESL) at the Texas Engineering Experiment Station of the Texas A&M University System is pleased to provide this preliminary report, "Energy Efficiency/Renewable Energy Impact in the Texas Emissions Reduction Plan (TERP): Integrated NO_x Emissions Savings from EE/RE Programs Statewide," as required under Texas Health and Safety Code Ann. § 388.003 (e), Vernon Supp. 2002 (Senate Bill 5, 77R as amended 78 R & 78S).

The ESL is required to annually report the energy savings from statewide adoption of the Texas Building Energy Performance Standards in Senate Bill 5 (SB 5), as amended, and the relative impact of proposed local energy code amendments in the Texas non-attainment and near-non-attainment counties as part of the Texas Emissions Reduction Plan (TERP).

Please contact me at (979) 862-1280 should you or any of the TCEQ staff have any questions concerning this report or any of the work presently being done to quantify emissions reductions from energy efficiency and renewable energy measures as a result of the TERP implementation.

Sincerely,

A handwritten signature in black ink that reads "David E. Claridge". The signature is fluid and cursive.

David E. Claridge, Ph.D., P.E., FASHRAE
Director

Enclosure

cc: Commissioner Toby Baker
Executive Director Zak Covar

**PRELIMINARY REPORT:
INTEGRATED NOX EMISSIONS SAVINGS FROM EE/RE STATEWIDE**

**Energy Efficiency/Renewable Energy Impact
In The Texas Emissions Reduction Plan**

Executive Summary

The Energy Systems Laboratory (Laboratory), at the Texas Engineering Experiment Station of the Texas A&M University System, in fulfillment of its responsibilities under Texas Health and Safety Code Ann. § 388.003 (e), Vernon Supp. 2002, submits this sixth annual report, Energy Efficiency/Renewable Energy (EE/RE) Impact in the Texas Emissions Reduction Plan (Preliminary Report) to the Texas Commission on Environmental Quality.

In this preliminary report, the NOx emissions savings from the energy-efficiency programs from multiple Texas State Agencies working under Senate Bill 5 and Senate Bill 7 in a uniform format to allow the TCEQ to consider the combined savings for Texas’ State Implementation Plan (SIP) planning purposes. This required that the analysis should include the integrated savings estimates from all projects projected through 2020 for both the annual a NOx reductions. The year of 2008 was used for the baseline year to estimate the emissions. The NOx emissions reduction from all these programs were calculated using estimated emissions factors for 2010 from the US Environmental Protection Agency (US EPA) eGRID database, which had been specially prepared for this purpose.

In 2012, the integrated total electricity savings from all programs are:

- Annual electricity savings is 16,413,917 MWh/year (4,609 tons-NOx/year) and
- OSD electricity savings is 44,366 MWh/day, which would be a 1,849 MW average hourly load reduction during the OSD period (12.35 tons-NOx/day).

By 2013, the integrated total electricity savings from all programs are:

- Annual electricity savings will be 17,661,268 MWh/year (4,959 tons-NOx/year) and
- OSD electricity savings will be 47,607 MWh/day, which would be a 1,984 MW average hourly load reduction during the OSD period (13.26 tons-NOx/day).

A summary of the savings for 2012 and 2013 is presented in the table below. (Base year 2008)

	2012	2013
Annual Electricity Savings (MWh/yr)	16,413,917	17,661,268
Annual Emissions Reductions (tons NOx/yr)	4,609	4,959
OSD Electricity Savings (MWh/day)	44,366	47,607
OSD Emissions Reductions (tons NOx/day)	12.35	13.26

Legislative Background

In 2001, the Texas Emissions Reduction Plan (TERP), established by the 77th Texas Legislature with the enactment of Senate Bill 5 (SB 5), identified that Energy Efficiency and Renewable Energy (EE/RE) measures make an important contribution to a comprehensive approach for meeting the minimum federal ambient air quality standards. In 2003 through 2007, the 78th, 79th and 80th Legislatures enhanced the use of EE/RE programs for meeting the TERP. The 78th Legislature enhanced the use of EE/RE programs for meeting TERP goals by requiring the Texas Commission on Environmental Quality (TCEQ) to promote EE/RE as a means to improve air quality standards and to develop a methodology for computing emissions reduction for use in the State Implementation Plan (SIP) from EE/RE programs.

The 79th Legislature expanded the scope of the SIP-eligible credits by adding savings from the State Renewable Portfolio Standards from the generation of electricity from renewable sources; specifically requiring the TCEQ to develop methods to quantify emissions reductions from renewable energy; and required the Laboratory to develop at least 3 alternative methods for achieving a 15 percent greater potential energy savings in residential, commercial and industrial construction.

In the 80th Legislature several new energy efficiency initiatives were introduced, including: requiring the Laboratory to provide written recommendations to the State Energy Conservation Office (SECO) about whether or not the energy efficiency provisions of latest published edition of the International Residential Code (IRC), or the International Energy Conservation Code (IECC), are equivalent to or better than the energy efficiency and air quality achievable under the editions adopted under the 2001 IRC/IECC; requiring the Laboratory to develop a standardized report format to be used by providers of home energy ratings; and encouraging the Laboratory to cooperate with an industry organization or trade association to develop guidelines for home energy ratings, including training.

Calculation of Integrated NO_x Emissions Reductions from Multiple State Agencies Participating in the Texas Emissions Reduction Plan (TERP)

In January 2005, the Laboratory was asked by the Texas Commission on Environmental Quality (TCEQ) to develop a method by which the NO_x emissions savings from the energy-efficiency programs from multiple Texas State Agencies working under Senate Bill 5 and Senate Bill 7 could be reported in a uniform format to allow the TCEQ to consider the combined savings for Texas' State Implementation Plan (SIP) planning purposes. This required that the analysis should include the integrated savings estimates from all projects projected through 2020 for both the annual and Ozone Season Day (OSD) NO_x reductions. The NO_x emissions reduction from all these programs were calculated using estimated emissions factors for 2010 from the US Environmental Protection Agency (US EPA) eGRID database, which had been specially prepared for this purpose. The different programs included in this 2012 integrated analysis are:

- ESL Single-family new construction
- ESL Multi-family new construction
- ESL Commercial new construction
- PUC Senate Bill 7 Program
- SECO Senate Bill 5 Program

- Electricity generated by wind farms in Texas (ERCOT)¹
- SEER 13 upgrades to Single-family and Multi-family residences

The Laboratory's single-family and multi-family programs include the energy savings obtained by new built residences in Texas. The baseline to estimate energy savings uses the published data on residential construction characteristics by the 2008 National Association of Home Builders (NAHB 2008) based on the IECC 2006 building code (ICC 2006). Annual electricity savings (MWh) are obtained from the Laboratory's Annual Reports to the TCEQ (Haberl et al., 2002 - 2012).

The Laboratory's commercial program includes the energy savings attained by new commercial buildings in Texas, including office, apartment, healthcare, education, retail, food and lodging buildings as defined by Dodge types (Dodge 2011). Energy savings were estimated from code compliant buildings (ASHRAE standard 90.1-2007) against pre-code buildings (ASHRAE standard 90.1-2004) using EUI's from the USDOE report and building square footage provided in the Dodge data (Dodge 2011).

The Texas Public Utility Commission's (PUC) Senate Bill 7 program include the energy efficiency programs implemented by electric utilities under the Public Utility Regulatory Act §39.905 (PUC 2013). The PUC regulated energy efficiency program was adopted pursuant to 1999 legislation (SB 7) and subsequent legislation in 2001 (SB 5), 2007 (HB 3693), and 2011 (SB 1125). The energy efficiency measures include high efficiency HVAC equipment, variable speed drives, increased insulation levels, infiltration reduction, duct sealing, Energy Star Homes, etc. Annual electricity savings according to the utilities were reported for the different programs completed in the years 2001 through 2012.

The Texas State Energy Conservation Office (SECO) funds energy-efficiency programs that are directed towards school districts, government agencies, city and county governments, private industries and residential energy consumers. For the 2012 reporting year SECO submitted annual energy savings values for projects funded by SECO and by Energy Service projects.

The Electric Reliability Council of Texas (ERCOT) electricity production from currently installed green power generation (wind) in Texas is reported. Projections through 2013 include planned projects by ERCOT, annual growth factors beyond 2013 comply with the Legislative requirements. Actual measured electricity production for 2001 through 2012, were included.

Finally, NO_x emissions reductions from *the installation of SEER 13 air conditioners in existing residences* are also reported.

Description of the Analysis Method

Annual and Ozone Season Day (OSD) NO_x emissions reduction were calculated for 2012 and integrated from 2009 to 2020 using several factors to discount the potential savings. These factors include an annual degradation factor, a transmission and distribution factor, a discount factor, and growth factors as shown in Table 1 and are described as follows:

Annual degradation factor: This factor was used to account for an assumed decrease in the performance of the measures installed as the equipment wears down and degrades. With the

¹ ERCOT is the Electric Reliability Council of Texas.

exception of electricity generated from wind, an annual degradation factor of 2% was used for ESL Single-family, Multi-family, and commercial programs and an annual degradation factor of 5% was used for all other programs². The value of the 5% degradation factor was taken from a study by Kats et al. (1996).

Transmission and distribution loss: This factor adjusts the reported savings to account for the loss in energy resulting from the transmission and distribution of the power from the electricity producers to the electricity consumers. For this calculation, the energy savings reported at the consumer level are increased by 7% to give credit for the actual power produced that is lost in the transmission and distribution system on its way to the customer. In the case of electricity generated by wind, the T&D losses were assumed to cancel out since wind energy is displacing power produced by conventional power plants; therefore, there is no net increase or decrease in T&D losses.

Initial discount factor: This factor was used to discount the reported savings for any inaccuracies in the assumptions and methods employed in the calculation procedures. For the Laboratory's single, multi-family and commercial program, the discount factor was assumed to be 20%. For PUC's Senate Bill 7 program and electricity from wind, the discount factor was taken as 10%. For the savings in the SECO program, the discount factor was 60%. In addition, the discount factor for SEER 13 single-family and SEER 13 multi-family program was 20%.

Growth factor: The growth factors shown in Table 1 were used to account for several different factors. Growth factors for single-family (3.3%), multi-family residential (1.5%), and commercial (3.3%) construction are projections based on the average growth rate for these housing types from recent U.S. Census data for Texas. Growth factor for wind energy (3.9%) is a linear projection based on the installed wind power capacity for 2009 through 2012 from the Texas Public Utilities Commission. No growth was assumed for PUC programs, SECO, and SEER 13 entries.

Figure 1 shows the overall information flow that was used to calculate the NO_x emissions savings from the annual and Ozone Season Day (OSD) electricity savings (MWh) from all programs. For the Laboratory's single-family and multi-family code-implementation programs, the annual and OSD were calculated from DOE-2 hourly simulation models³. The base case is taken as the average characteristics of single- and multi-family residences for Texas published by the National Association of Home Builders for 2008 (NAHB 2008). The annual electricity savings from PUC programs were calculated using demand savings tables created for the utilities incentive programs by Frontier Associates in Austin, Texas (PUC 2013). The OSD consumption is the average daily consumption for the period between July 15 and September 15.

The SECO electricity savings were submitted as annual savings by project⁴. A description of the measures completed for the project was also submitted for information purposes. The electricity production from wind farms in Texas was from the actual on-site metered data measured at 15-minute intervals.

² A degradation of 5% per year would accumulate as a 5%, 10%, 15%...etc, degradation in performance. Although the assumption of this high level of degradation may not actually occur, it was chosen as a conservative estimate. For wind energy, a degradation factor of 0% was used. The choice of a 0% degradation factor for wind is based on two year's of analysis of measured wind data from all Texas wind farms that shows no degradation, on average, for a two year period after the wind farms became operational.

³ These values are based on a performance analysis as defined by Chapter 4 of IECC 2006. This analysis is discussed in the Laboratory's annual reports to the TCEQ.

⁴ The reporting requirements to the SECO did not require energy savings by project type, although for selected sites, energy savings by project type was available.

Integration of the savings from the different programs into a uniform format allowed for creditable NO_x emissions to be evaluated using different criteria as shown in Table 1. These include evaluation across programs, evaluation across individual counties by program, evaluation by SIP area, evaluation for all ERCOT counties except Houston/Galveston, and evaluation within a 200 km radius of Dallas/Ft. Worth.

Calculation Procedure

The electricity savings in this report was estimated based on the baseline year of 2008. In addition, the emissions estimation throughout this report was based on the 2010 eGrid database which is using the four different Congestion Management (CM) zones: Houston, North, West, and South. This report calculates the OSD emissions reductions by dividing the annual emissions reductions with 365 since the 2010 eGrid estimates the annual emissions only. However, the OSD emissions reduction from the Electricity Generated by Wind Farms was estimated by actual measured data.

ESL Single-family and Multi-family. The calculation of the annual electricity savings reported for the years 2002 through 2012 included the savings from code-compliant new housing in all 41 non-attainment and affected counties as reported in the Laboratory's annual report submitted by the Laboratory to the Texas Commission of Environmental Quality (TCEQ). From 2009 to 2012, based on year 2008, the annual electricity savings were calculated for new residential construction in all the counties in ERCOT region, which includes the 41 non-attainment and affected counties. These savings were then tabulated by county and program. Using the calculated values through 2012, savings were then projected to 2020 by incorporating the different adjustment factors mentioned above.

In these calculations, it was assumed that the same amount of electricity savings from the code-complaint construction would be achieved for each year after 2012 through 2020⁵. The projected energy savings through 2020, according to county, were then divided into the CM zones in the 2010 eGRID. To determine which CM zone was to be used, or in counties with multiple CM zone, the allocation to each CM zone by county was obtained from CM zone's listing published in the Laboratory's 2010 annual report⁶.

For the 2012 annual NO_x emissions calculations, the US EPA's 2010 eGRID were used. An example of the eGRID spreadsheet⁷ is given in the Table 2. The total electricity savings for each CM zone were used to calculate the NO_x emissions reduction for each of the different counties using the emissions factors contained in eGRID. Similar calculations were performed for each year for which the analysis was required.

ESL-Commercial Buildings. The annual electricity savings for 2004 through 2012 for commercial buildings were obtained from the annual reports for 2004 through 2012 submitted by the Laboratory to TCEQ⁸. From 2009 to 2012, based on year 2008, the annual electricity savings were also calculated for new commercial construction by county. Using the calculated values through 2012, savings were then projected to 2020 by incorporating the different adjustment

⁵ This would include the appropriate discount and degradation factors for each year.

⁶ Haberl et al., 2010, pp. 265.

⁷ To use this spreadsheet electricity savings for each eGrid zone is entered in the bottom row of the spreadsheet (MWh). The spreadsheet then allocates the MWh of electricity savings according to the counties (blue columns) where the CM zone owned and operated a power plant. Totals for all CM zones are then listed on the far right columns (white columns). Similar spreadsheets for the 2010 eGRID exist for SO_x and CO₂.

⁸ These savings include new construction in office, education, retail, food, lodging and warehouse construction as defined by Dodge building type (Dodge 2011), using energy savings from the US DOE's report (USDOE 2011), and data from CBECS (1995 - 2003).

factors mentioned above⁹. In the projected annual electricity savings, it was assumed that the same 2012 amount of electricity savings would be achieved for each year through 2020. Similarly to the single family calculations, the projected energy saving numbers through 2020, by county, were allocated into the appropriate CM zones

PUC-Senate Bill 7. For the PUC Senate Bill 7 program savings, the annual electricity savings for 2001 through 2012 were obtained from the Public Utilities Commission. Using these values savings were projected through 2020 by incorporating the different adjustment factors mentioned above. Similar savings were assumed for each year after 2012 until 2020. The 2010 annual eGRID was also used to calculate the NOx emissions savings for the PUC-Senate Bill 7 program. The total electricity savings for each CM zone was used to calculate the NOx emissions reduction for each county using the emissions factors contained in the US EPA's eGRID spreadsheet. The integrated NOx emissions reduction for each county was then calculated.

SECO Savings. The annual electricity savings from energy conservation projects reported by political subdivisions for 39 counties through 2012 were obtained from the State Energy Conservation Office. These submittals included information gathered from SECO's website¹⁰ and paper submittals¹¹. The annual and average day electricity values were then summarized according to county and program. Using the actual reported numbers for 2007 through 2012, savings through 2020 were projected using the different adjustment factors mentioned above. In a similar fashion to the previous programs, it was assumed that the same amount of electricity savings will be achieved for each year through 2020. The 2010 annual eGRID were then used to calculate the NOx emissions savings for the SECO program.

Electricity Generated by Wind Farms. The measured electricity production from all the wind farms in Texas for 2001 through 2012 was obtained from the Energy Reliability Council of Texas (ERCOT). To obtain the annual production, the 15-minute data were summed for the 12 months. Using the reported numbers for 2012, savings through 2020 were projected incorporating the different adjustment factors mentioned above. The 2007 annual eGRID were then used to calculate the NOx emissions reduction for the electricity generated by Texas' wind farms¹². The total electricity savings for each CM zone was used to calculate the NOx emissions reduction for each of the different counties.

SEER 13 Single-Family and Multi-Family. In January of 2006, Federal regulations mandated that the minimum efficiency for residential air conditioners be increased to SEER 13 from the previous SEER 10. Although the electricity savings from new construction reflected this change in values, the annual and OSD electricity savings from the replacement of the air conditioning units by air conditioners with an efficiency of SEER 13 in existing residences needed to be calculated.

In the 2012 report to the TCEQ, the annual and OSD electricity savings for all the counties in ERCOT region as well as the 41 non-attainment and affected counties were calculated. Using the numbers for 2006, the savings after 2006 until 2020 were projected by incorporating the

⁹ This also includes the appropriate discount and degradation factors for each year.

¹⁰ This web site was developed for SECO by the Laboratory, at the request of the TCEQ.

¹¹ In these submittals, there were several municipalities whose electricity or natural consumption increased in 2004 as compared to 2001, which caused the reported savings from these municipalities to be negative. Since no additional information was reported from these projects that might have indicated what the cause of this was, it was assumed that the energy conservation projects were working as designed, but that other factors had changed the energy consumption. Therefore, in the final values of electricity savings from the political subdivisions that reported to SECO for the calculation of annual NOx reductions, the negative savings were omitted.

¹² This credited the electricity generated by the wind farm to the utility that either owned the wind farm or was associated with the wind farm owner.

appropriate adjustment factors¹³. In this analysis, it was assumed that an equal number of existing houses had their air conditioners replaced, as reported for 2006, by the air conditioner manufacturers. This replacement rate continued until all the existing air conditioner stock was replaced with SEER 13 air conditioners. The total electricity savings for each PCA were used to calculate the NOx emissions reduction for each of the different county using the emissions factors contained in the 2010 eGRID. Integrated NOx emissions reduction for each county by SIP area was also calculated.

Results

The total integrated annual and OSD electricity savings for all the different programs in the integrated format was calculated using the adjustment factors shown in Table 1 for 2009 through 2020 as shown in Table 3. Annual and OSD NOx emissions reduction from the electricity savings (presented in Table 3) for all the programs in the integrated format is shown in Table 4.

In 2012, the total integrated annual savings from all programs is 16,413,917 MWh/year. The integrated annual electricity savings from all the different programs is:

- Savings from code-compliant residential and commercial construction is 498,883 MWh/year (3.0% of the total electricity savings),
- Savings from the PUC's Senate Bill 7 program is 1,831,318 MWh/year (11.2%),
- Savings from SECO's Senate Bill 5 program is 714,891 MWh/year (4.4%),
- Electricity savings from green power purchases (wind) is 13,049,580 MWh/year (79.5%), and
- Savings from residential air conditioner retrofits¹⁴ is 319,244 MWh/year (1.9%).

In 2012, the total integrated OSD savings from all programs is 44,366 MWh/day, which would be a 1,849 MW average hourly load reduction during the OSD period. The integrated OSD electricity savings from all the different programs is:

- Savings from code-compliant residential and commercial construction is 1,852 MWh/day (4.2%),
- Savings from the PUC's Senate Bill 7 programs is 5,017 MWh/day (11.3%),
- Savings from SECO's Senate Bill 5 program is 1,959 MWh/day (4.4%),
- Electricity savings from green power purchases (wind) are 33,273 MWh/day (75.0%), and
- Savings from residential air conditioner retrofits are 2,264 MWh/day (5.1%).

By 2013, the total integrated annual savings from all programs is 17,661,268 MWh/year. The integrated annual electricity savings from all the different programs is:

- Savings from code-compliant residential and commercial construction is 682,701 MWh/year (3.9% of the total electricity savings),
- Savings from the PUC's Senate Bill 7 program is 2,205,082 MWh/year (12.5%),
- Savings from SECO's Senate Bill 5 program is 909,903 MWh/year (5.2%),
- Electricity savings from green power purchases (wind) is 13,560,301 MWh/year (76.8%), and
- Savings from residential air conditioner retrofits is 303,282 MWh/year (1.7%).

¹³ Additional details about this calculation are contained in the Laboratory's 2006 Annual Report to the TCEQ, available at the Senate Bill 5 web site "eslsb5.tamu.edu".

¹⁴ This assumes air conditioners in existing homes are replaced with the more efficient SEER 13 units, versus an average of SEER 11, which is slightly more efficient than the previous minimum standard of SEER 10.

By 2013, the total integrated OSD savings from all programs is 47,607 MWh/day, which would be a 1,984 MW average hourly load reduction during the OSD period. The integrated OSD electricity savings from all the different programs is:

- Savings from code-compliant residential and commercial construction is 2,346 MWh/day (4.9%),
- Savings from the PUC's Senate Bill 7 programs is 6,041 MWh/day (12.7%),
- Savings from SECO's Senate Bill 5 program is 2,493 MWh/day (5.2%),
- Electricity savings from green power purchases (wind) are 34,575 MWh/day (72.6%), and
- Savings from residential air conditioner retrofits are 2,151 MWh/day (4.5%).

In 2012 (Table 4), the total integrated annual NO_x emissions reduction from all programs is 4,609 tons-NO_x/year. The integrated annual NO_x emissions reduction from all the different programs is:

- NO_x emissions reduction from code-compliant residential and commercial construction is 126 tons-NO_x/year (2.7% of the total NO_x savings),
- NO_x emissions reduction from the PUC's Senate Bill 7 programs is 522 tons-NO_x/year (11.3%),
- NO_x emissions reduction from SECO's Senate Bill 5 program is 221 tons-NO_x/year (4.8%),
- NO_x emissions reduction from green power purchases (wind) is 3,665 tons-NO_x/year (79.5%), and
- NO_x emissions reduction from residential air conditioner retrofits is 75 tons-NO_x/year (1.6%).

In 2012, the total integrated OSD NO_x emissions reduction from all programs is 12.35 tons-NO_x/day. The integrated OSD NO_x emissions reduction from all the different programs is:

- NO_x emissions reduction from code-compliant residential and commercial construction is 0.47 tons-NO_x/day (3.8%),
- NO_x emissions reduction from the PUC's Senate Bill 7 programs is 1.43 tons-NO_x/day (11.6%),
- NO_x emissions reduction from SECO's Senate Bill 5 program is 0.60 tons-NO_x/day (4.9%),
- NO_x emissions reduction from green power purchases (wind) are 9.32 tons-NO_x/day (75.5%), and
- NO_x emissions reduction from residential air conditioner retrofits are 0.53 tons-NO_x/day (4.3%).

By 2013, the total integrated annual NO_x emissions reduction from all programs will be 4,959 tons-NO_x/year. The integrated annual NO_x emissions reduction from all the different programs is:

- NO_x emissions reduction from code-compliant residential and commercial construction will be 172 tons-NO_x/year (3.5% of the total NO_x savings),
- NO_x emissions reduction from the PUC's Senate Bill 7 programs will be 629 tons-NO_x/year (12.7%),
- NO_x emissions reduction from SECO's Senate Bill 5 program will be 277 tons-NO_x/year (5.6%),
- NO_x emissions reduction from green power purchases (wind) will be 3,809 tons-NO_x/year (76.8%), and

- NOx emissions reduction from residential air conditioner retrofits will be 71 tons-NOx/year (1.4%).

By 2013, the total integrated OSD NOx emissions reduction from all programs is 13.26 tons-NOx/day. The integrated OSD NOx emissions reduction from all the different programs is:

- NOx emissions reduction from code-compliant residential and commercial construction will be 0.59 tons-NOx/day (4.5%),
- NOx emissions reduction from the PUC's Senate Bill 7 programs will be 1.72 tons-NOx/day (13.0%),
- NOx emissions reduction from SECO's Senate Bill 5 program will be 0.76 tons-NOx/day (5.7%),
- NOx emissions reduction from green power purchases (wind) will be 9.69 tons-NOx/day (73.1%), and
- NOx emissions reduction from residential air conditioner retrofits will be 0.50 tons-NOx/day (3.8%).

Summary

This preliminary report shows the NOx emissions savings from the energy-efficiency programs from multiple Texas State Agencies working under Senate Bill 5 and Senate Bill 7 in a uniform format to allow the TCEQ to consider the combined savings for Texas' State Implementation Plan (SIP) planning purposes. This required that the analysis should include the integrated savings estimates from all projects projected through 2020 for the annual and OSD NOx reduction. The NOx emissions reduction from all these programs were calculated using estimated emissions factors for 2010 from the US Environmental Protection Agency (US EPA) eGRID database, which had been specially prepared for this purpose.

In 2012, the integrated total electricity savings from all programs are:

- Annual electricity savings is 16,413,917 MWh/year (4,609 tons-NOx/year) and
- OSD electricity savings is 44,366 MWh/day, which would be a 1,849 MW average hourly load reduction during the OSD period (12.35 tons-NOx/day).

By 2013, the integrated total electricity savings from all programs are:

- Annual electricity savings will be 17,661,268 MWh/year (4,959 tons-NOx/year) and
- OSD electricity savings will be 47,607 MWh/day, which would be a 1,984 MW average hourly load reduction during the OSD period (13.26 tons-NOx/day).

The Laboratory has and will continue to provide leading-edge technical assistance to counties and communities working toward obtaining full SIP credit for the energy efficiency and renewable energy projects that are lowering emissions and improving the air for all Texans. The Laboratory will continue to provide superior technology to the State of Texas through efforts with the TCEQ and US EPA. The efforts taken by the Laboratory have produced significant success in bringing EE/RE closer to US EPA acceptance in the SIP.

If any questions arise, please contact us by phone at 979-845-6065 or email us at terpinfo@tees.tamus.edu.

Table 1: Final Adjustment Factors used for the Calculation of the Annual and OSD NOx Savings for the Different Programs

	ESL- Single Family	ESL- Multi Family	ESL- Commercial	PUC (SB7)	SECO	Wind-ERCOT	SEER13 Single Family	SEER13 Multi Family
Annual Degradation Factor	2.0%	2.0%	2.0%	5.0%	5.0%	0.0%	5.0%	5.0%
T&D Loss	7.0%	7.0%	7.0%	7.0%	7.0%	0.0%	7.0%	7.0%
Initial Discount Factor	20.0%	20.0%	20.0%	10.0%	60.0%	10.0%	20.0%	20.0%
Growth Factor	3.3%	1.5%	3.3%	0.0%	0.0%	3.9%	N.A.	N.A.
Weather Normalized	Yes	Yes	Yes	No	No	No ¹	Yes	Yes

Note:

- For Wind-ERCOT, the OSD energy consumption is the average daily consumption of the measured data in the months of July, August and September.
