HEALTH AND VIGOR of pecan trees and satisfactory nut quality and yield depend on a well-planned, well-executed insect and disease control program. Insect and disease losses can be reduced with sound grove management and sanitation practices and by following suggested spray schedules.

Zinc Nutrition
Pecans require zinc for normal stem growth. Trees not receiving zinc can not produce the plant growth hormone, indole acetic acid, and short clustered stems result. This disorder is known as “zinc rosette.” Texas soils are predominantly alkaline and do not contain “available” zinc; therefore, zinc must be applied to the foliage. Frequent application of zinc is important early in the season in order to obtain optimum stem elongation and leaf expansion.

When and How to Spray
Prevention of losses to most diseases and some insects requires strict adherence to properly timed spray application schedules. The accompanying table specifies when applications should be made in relation to tree development or at specific times during the season. Thorough spray coverage of the trees with each application is essential for effective control.

With conventional high-volume hydraulic sprayers, 1/2 to 1 gallon of spray mixture per foot of tree height normally is required for proper coverage. Pressure should be maintained at 300 to 400 psi. Low volume sprayers (mist blowers, air blast sprayers, speed sprayers, etc.) utilize forced air as the carrier to deliver the spray mix, and proportionately less water is required to deliver the recommended amount of pesticide per tree. When using such air delivery sprayers, follow carefully the manufacturer’s directions for mixing spray materials and for calibrating the sprayer. Dilutions in the accompanying table of pesticide suggestions are for conventional hydraulic sprayers: adjustments in water ratios are necessary for other types of sprayers.

Commercial producers need to be able to recognize the major insect and disease problems likely to occur in their grove. Detailed information on disease and insect recognition, development of life history, and potential damage is in MP-313, Pecan Diseases and Insects, a publication available from your county Extension agent.

Precautions on Chemical Use
Select suggested materials for most effective, safe, economical control. All materials suggested are poisonous, but proper handling reduces hazards associated with use. Comply with manufacturers’ directions for handling pesticides or fungicides.

Residues. The Environmental Protection Agency has established certain pesticidal residue tolerances on pecans. These regulations require that certain chemicals should not be applied near harvest. Always consult the product label for specific restrictions.

Caution. Most pesticides and fungicides are poisonous. Use them with caution, and store them out of reach of children, irresponsible persons, livestock and household pets. Properly dispose of leftover spray material and containers. Observe explicitly all precautions on labels.

Pesticide Drift. Avoid drift to adjoining crops or other produce. Take precautions against pond and stream contamination to prevent fish mortality. Avoid pesticide drift on bee hives, wild bee nesting sites and plants in bloom.

Symptoms of Poisoning. Some symptoms of pesticide poisoning are headache, nausea, cramps, blurred vision, weakness, muscular twitching and diarrhea. If any of these symptoms occur during or following the handling of any pesticide, consult a doctor immediately.

Pollination and bee poisoning. Many agricultural and horticultural crops are dependent upon pollinating insects for production. Honey bee colonies are rented for pollination service in tree fruits, cucurbits, vegetables, legume seeds and other crops. Bumble bees, alkali bees, alfalfa leafcutting bees and other wild bee species provide essential pollination in certain areas of Texas. Growers must take special...
Caution: This is a scientific and technical document. It is intended for use in the control of insect and disease pests on pecan orchards. The information provided is based on studies and recommendations by the Texas Agricultural Extension Service and the Texas Agricultural Experiment Station. It is important to note that the effectiveness and suitability of the pesticides listed may vary depending on local conditions and regulations. Always read and follow the instructions on the container label carefully. Contact your county Extension agent or appropriate specialists for further information.

Relative Bee Hazard of Pesticides

Highly toxic at any time
- Carbaryl (Sevin®)
- Dimethoate (Cygon®, De-Fend®)
- Parathion
- EPN
- Azinphosmethyl (Guthion®)

Hazardous if applied in early morning or during the day.
- Benomyl (Benlate®)
- Cyprex®
- Benlate®
- Polyram®
- Zinc sulfate

Nonhazardous at any time
- Disulfoton (Di-Syston®) G
- Oil Sprays
- Sulfur
- Endosulfan (Thiodan®)
- Phosalone (Zolone®)
- Toxaphene

Suggestions for Controlling Insects and Diseases on Commercial Pecans

</tr>
</thead>
<tbody>
<tr>
<td>Dormant (winter)</td>
<td>Scale and phylloxera (galls)</td>
<td>Dormant oil - 3 1/2 gal. of a 97% oil emulsion</td>
<td>0</td>
<td>For phylloxera, spray tree trunk thoroughly with dormant oil emulsion. If dormant oil is not applied, use 3 lb. of malathion wettable powder per 100 gal. water when leaves are one-third grown.</td>
</tr>
<tr>
<td>Prepollination: (When leaves are 1/2 grown and before pollen is shed)</td>
<td>Scab</td>
<td>Benomyl (Benlate®) 50% WP 1/2 lb./A or Hydroxytriophenyltin (Du-Ter®) 47% WP - 1/2 lb. or Dodine (Cyprex®) - 0.75 lb. or Metiram (Polyram®) 80% WP 2.0 lbs.</td>
<td></td>
<td>Cyprex may cause foliage bum on Moore and Burkett varieties when used with Guthion. Benlate used at the rate of 1/2 lb./A on small trees and 1 lb./A on trees greater than 30 ft. in height. Polyram has performed well in the West Cross Timbers area and west. Due to intense disease pressure, it may not perform as well in South Central, East Texas and Gulf Coast areas.</td>

</table>

Suggested use of pesticides made by the Texas Agricultural Extension Service and the Texas Agricultural Experiment Station are based upon:

- Effectiveness under Texas conditions.
- Avoidance of residues in excess of allowable tolerances.
- Avoidance of toxicity to desirable vegetation, animals and humans.
- Avoidance of adverse side effects upon beneficial predators, parasites, honey bees, fish and other wildlife, plants, and animals and humans.

Suggested pesticides must be registered and labeled for use by the U. S. Environmental Protection Agency and the Texas Department of Agriculture. The status of pesticide label clearances is subject to change, and may have changed since this publication was printed. County Extension agents and appropriate specialists are advised of changes as they occur. The USER always is responsible for the effects of pesticide residues on his livestock and crops, as well as problems that could arise from drift or movement of the pesticide from his property to that of others. Always read and follow carefully the instructions on the container label.

For further information, contact your county Extension agent or Project Leader in Pesticide Chemicals, Texas A&M University (713)845-1353.

---|---|---|---|---
Soon after pollination as eggs appear on tips of nutlets | Rosette | Zinc Sulfate 78% WP - 2 lbs. | | Zinc sulfate - foliar application only. Zinc absorption can be increased by adding 3 pints of a 32% ammonium nitrate: urea solution per 100 gal. of water. Do not use at higher strengths, since foliage burn results.
| Pecan nut case-bearing | Azinphosmethyl (Guthion®) 25% WP - 1½ lb. | See Remarks | | Eggs usually are deposited on tips of nuts. Examine nutlet clusters for greenish white eggs. Spray nutlet clusters thoroughly when eggs are present. Banding is valuable in timing applications and in indicating need for repeat applications. (See L-702)
| | Carbaryl (Sevin®) 80% WP 2 lbs. | See Remarks | | AZINPHOSMETHYL - do not apply after shuck split. Do not graze livestock in treated groves for 21 days after treatment.
| | Endosulfan (Thiodan®) 50% WP - 1 lb. | See Remarks | | CARBARYL - do not apply after shuck split.
| | Malathion 25% WP - 3 lbs. | 0 | | ENDOSULFAN - do not graze livestock in treated groves. Do not apply after shuck split.
| | Phosalone (Zolone®) 25% WP 2 lbs. | See Remarks | | MALATHION - no time or grazing restrictions.
| | Toxaphene 40% WP - 5 lbs. | 0 | See Remarks | PHOSALONE - do not allow livestock to graze in treated groves. Because of the likelihood of fish kill, this material should not be used near rivers, lakes or streams.

| Scab | Same as Prepollination | Same as Prepollination | | Same as Prepollination
| Rosette | Same as Prepollination | Same as Prepollination | | Same as Prepollination
| Scab | Same as Prepollination | | This application may be required in areas of moderate to high rainfall and others when rain is frequent.
| Rosette | Same as Prepollination | | Same as Prepollination
| Scab | Same as Prepollination | | This application may be required in areas of moderate to high rain and when rain is frequent.
| Rosette | Same as Prepollination | | Same as Prepollination

May or early June | Aphids | Disulfoton (Di-Syston®) - 13.5 lb. 15% granules per acre | 80 | Season-long control where properly applied and where soil moisture is adequate for uptake. Irrigate immediately after application, where possible. Apply in 6-foot bands on two or four sides of trees. Locate bands in tree’s main "drip area." Work into upper 2 to 3 inches of soil in clean tilled groves and beneath grass roots (6-8 inches) in sodded groves. One application per season.
| | Disulfoton (Di-Syston®) - 2 ¾ pt. 65.7% EC per acre | 80 | | DIMETHOATE - do not graze livestock in treated groves. Apply only with ground equipment.
| When present | Aphids | Dimethoate (Cygon® or De-Fend®) 1 pt. of 30.5% EC | 21 | PHOSALONE - see remarks above on pecan nut case-bearing.
| (Where disul- | Pecan spittlebug | Malathion - 3 lb. 25% WP | 0 | Black pecan aphid sucks juices from leaves. Bright yellow spots appear around feeding punctures. Spots turn brown and cause leaves to drop prematurely. Black pecan aphids do not feed in crowded colonies. Honeydew - producing aphids cause leaves to curl and turn brown. Considerable honeydew and sooty mold growth occur when bright yellow aphids occur in numbers. Spittlebug control seldom is required in Texas.
| foton soil | | Phosalone (Zolone®) 25% WP 2 lbs. (aphids only) | See remarks | | applications are not made)
