

### BRIDGING DAST PRESENT BRESENT BRUTURE AN ARCHITECTURAL INVESTIGATION IN ITS ROLE IN TIME

# **ASTRATERNO**

Well, Space is there, and we're going a ceimb it, and the moon and the planets are there, and new hopes for know the and peace are there. And, therefore, as we set sail we ask God's blending on the most hazardous and dangerous and there to the ask for which the ask has ever embarked.

To my all of the incredible people who have guided me on the development of this project,

It has truly been an unforgettable & incredible journey. Thank you for constantly pushing me to do my best and believing in me and this project.

Your collaboration and dedication to this project and to myself have been a blessing that I will always cherish as I continue my career in the architectural field. You have had inspiring role in the development of my passion for this particular field and I cannot thank you enough for all of the things that you have done for me over the past year leading up to this final moment.

Your passion drive, and dedication mimic the same qualities that the three Apollo 01 astronauts and the engineers at NASA had while pursuing their goals. They never gave up. They never settled.. They accomplished more than they set their eyes on. Theyleftalegacyforfuturegenerations.

You have left a legacy and a profound impact on me and every other person that has ever had the pleasure of working directly with you.

I am honored to have you been with me on this journey. I am incredibly thankful and blessed to have known such wonderful people.

Thank you for everything you have done from the bottom of my heart

Hillary Brown

#### **"TOUGH AND COMPETENT."**

#### "TOUGH MEANS WE ARE **FOREVER ACCOUNTABLE FOR WHAT WE DO OR WHAT WE FAIL TO DO**. WE WILL NEVER AGAIN COMPROMISE OUR RESPONSIBILITIES .

#### COMPETENT MEANS WE WILL **NEVER TAKE ANYTHING FOR GRANTED**. WE WILL **NEVER BE FOUND SHORT IN OUR KNOWLEDGE AND IN OUR SKILLS**.

WHEN YOU LEAVE THIS MEETING TODAY YOU WILL GO TO YOUR OFFICE AND THE FIRST THING YOU WILL DO THERE IS TO WRITE "TOUGH AND COMPETENT" ON YOUR BLACKBOARDS.

IT WILL NEVER BE ERASED.

EACH DAY WHEN YOU ENTER THE ROOM, T**HESE WORDS WILL REMIND YOU OF THE PRICE PAID BY** GRISSOM, WHITE, AND CHAFFEE. "

Architecture has tangible qualities that embody a work's physical makeup and intangible qualities that contribute to the feeling and expression of time. Every building has moments of time embedded in their fabric that expresses the past, present, and future. Some of these moments are expressed in materials, whether they show signs of decay, or they are sleek, newly fabricated and installed. They are also expressed in site and location, where moments of history existed long ago, or the stage of significance for future events that could possibly shape history. Present day is constantly expressed in any architectural work that is occupied by users. Each element of time is expressed in architecture.

Architectural works are moments themselves existing in a continuous time line that can easily express their moments in time. Architectural design that has been created, can act as a tangible and intangible forces that expresses the concept of time.

#### DOCTOR BRIAN COX FOR BBC EXPLAINING THE THEORY OF RELATIVITY

Professor Cox takes a member of the audience and has him move a flashlight up and down, showing the flashlight as a ticking clock

He then moves him across the stage, still moving his flashlight "clock".

The audience then perceives his movement across the stage.

Time remains the same to him while the audience perceives the time being longer.

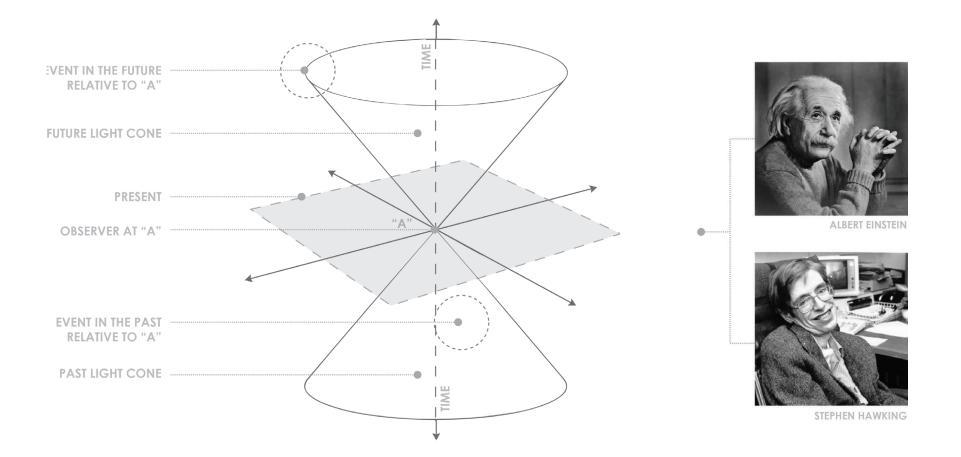

Prof. Cox then demonstrates how time is relative to the observer and that time travel into the future is potentially possible.

"In relativity, on the other hand, all observers must agree on how fast light travels. They still, however, do not agree on the distance the light has traveled, so they must therefore now also disagree over the time it has taken.

In other words, the theory of relativity put an end to the idea of absolute time!

It appeared that each observer must have his own measure of time, as recorded by a clock carried with him, and that identical clocks carried by different observers would not." necessarily agree.

> STEPHEN HAWKING A BRIEF HISTORY OF TIME

Time, is a complicated subject which humans have tried exploring and quantifying throughout history. However, in the writing A Brief History of Time, Stephen Hawking seeks to explain major scientific findings regarding time in a short, ingenuous way. One of the key concepts he defines stems from Albert Einstein's finding on have time is objective to an individual. This concept became accepted as the Theory of Relativity. The theory of relativity is a concept in which "space" is identified in relationship with "time" In Hawking's writing; he diagrams this concept into two cones reflecting each other. The respective cones being labeled "future light" and "past light", with an individual in the center of where the two points meet. To the individual, the events that take place within the cones are either taking place in the future or within the past. Thus explaining that time is relevant to the individual.

This expression of time in general being relevant to a user can be directly showcased as a belief in architecture. Karen Franck's "Architecture Timed" expresses several briefs by different authors on architecture's relationship with time and human relationship with time in many ways. She states, "Instead of dwelling in a continuous duration, we now experience time as fragments that pass us and immediately vanish." This particular idea can be challenged however. By incorporating an apparent and fluid path, the idea of "fragments" becomes void, and lends itself to let the user experience the fluidity of time in a procession instead. Karen Franck also mentions how architecture subconsciously can influence the persistence of time by the spatial and material characteristics of a building. Some materials and their spatial relationship can subconsciously take an individual to a certain moment in time. For example, ancient ruins and their qualities of decay and roughness or modern age structures with their sleek and newly installed materials contribute to time expressed as age.

This "age" of materials contributes to an individual's sense of presence in time and acts as an "index". The idea of an "index" comes from C.S. Pierce explanation of symbols, icons, and indices. According to Peirce's findings, an index is a direct connection that is inferred or observed. Smoke would identify as an index to fire, just as the composition of the materials would act as indexes of time. These materials can overlap, contributing to a newly developed sense of time, where past and present occupy the same space, and the individual becomes consciously aware of the present time in which they occupy.

If we die, we want people to accept it.

#### WE ARE IN A RISKY BUSINESS, AND WE HOPE THAT IF ANYTHING HAPPENS TO US, IT WILL NOT DELAY THE PROGRAM.

THE CONQUEST OF SPACE IS WORTH THE RISK OF LIFE.

OUR GOD-GIVEN CURIOSITY WILL FORCE US TO GO THERE OURSELVES BECAUSE IN THE FINAL ANALYSIS, ONLY MAN CAN FULLY EVALUATE THE MOON IN TERMS UNDERSTANDABLE TO OTHER MEN.

#### **VIRGIL IVAN "GUS" GRISSOM**

APRIL 3, 1926 – JANUARY 27, 1967) SECOND AMERICAN TO FLY INTO SPACE

#### **AMERICAN TRAGEDY STRUCK**

on January 27, 1967 at Launch Complex 34 in Cape Canaveral, Florida. The first mission of the Apollo space program resulted in the accidental deaths of three pioneering astronauts, Gus Grissom, Ed Higgins White and Roger B. Chaffee. The event, though tragic in nature, was not one taken in vain. It launched a legacy of the quest of great exploration beyond our worldly limits. The tragedy pushed the men and women of the Apollo era to their extents and ultimately allowed them to achieve their goal of a lunar landing.

# RVCE TO THE WOON

#### AMERICA'S HISTORIC SITES THAT MAKE THE MOON LANDING POSSIBLE

This is a diagram showing some of the locations that landed men on the moon in 1969. Some of the facilities have seen the wear of time more so than others. The

\*

exploration of these places let to the site selection of the project. Ultimately the site of Launch Pad 34 was chosen to revitalize and renovate to house a new program .

### FLORIDA, USA THE SUNSHINE STATE + HOME OF THE SPACE PROGRAM

FLORIDA was not always the top choice for launching rockets into space. Florida's weather is ever changing. The weather also poses a threat of tropical storms and hurricanes. However, the sunshine state was chosen to become the home of hundred of rockets.

They specifically chose Cape Canaveral due to its location near the coast. Since the rockets they launched could potentially cause significant damage to the public if they failed, locating the site next to the coast could allow the engineers to

#### direct a failing rocket into the ocean instead.

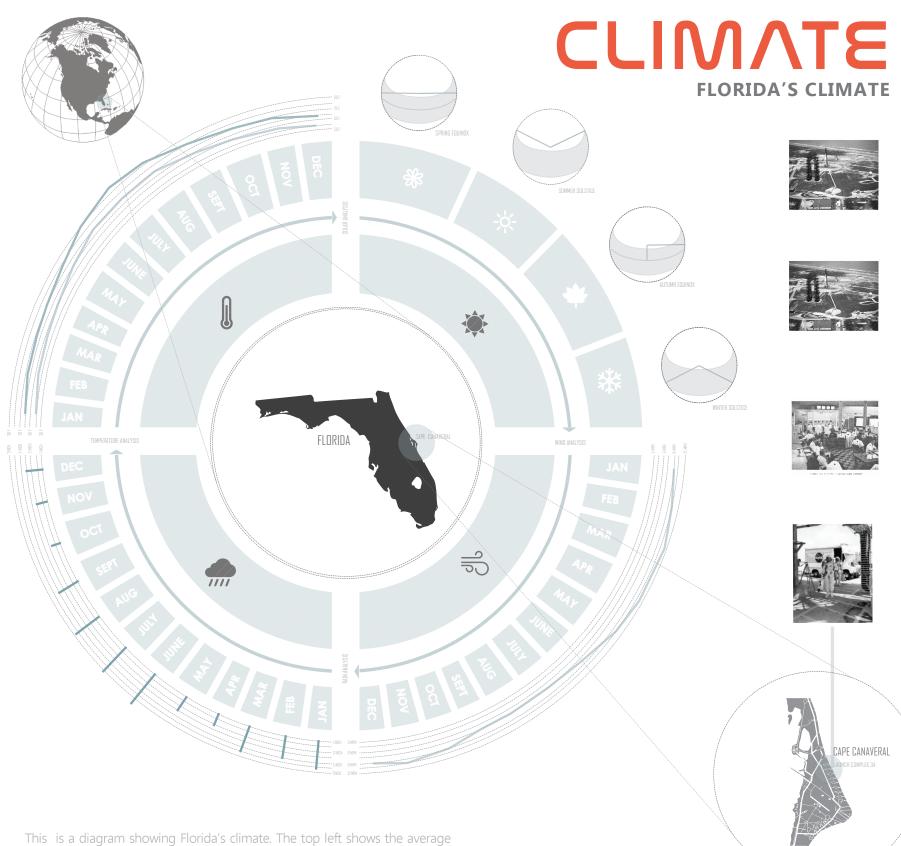

The cape also gives a speed boost to the rockets due to its location. Eastward velocity is greatest at the equator. The velocity is roughly 1,040 mph. So Cape Canaveral picks up a small boost for the rockets and allow them to gain 914 mph of added speed.

Ultimately these two perks are what drew NASA as to selecting Florida as the top destination of choice.

2) J 70

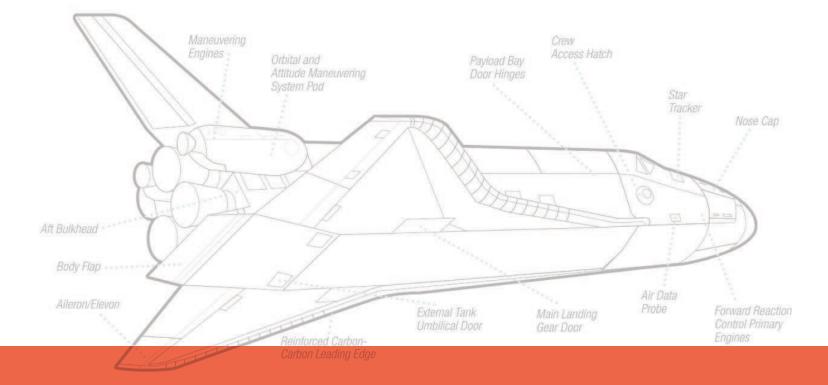

This is a diagram showing Florida's climate. The top left shows the average temperatures. The bottom left shows the average rainfall. The top right shows the sun's angle and the bottom right shows the average wind speed.

# CABO CAÑAREAL - THE CAPE OF CURRENTS

FLORIDA was not always the top choice for launching rockets into space. Florida's weather is ever changing. The weather also poses a threat of tropical storms and hurricanes. However, the sunshine state was chosen to become the home of hundred of rockets.

They specifically chose Cape Canaveral due to its location near the coast. Since the rockets they launched could potentially cause significant damage to the public if they failed, locating the site next to the coast could allow the engineers to direct a failing rocket into the ocean instead.

The cape also gives a speed boost to the rockets due to its location. Eastward velocity is greatest at the equator. The velocity is roughly 1,040 mph. So Cape Canaveral picks up a small boost for the rockets and allow them to gain 914 mph of added speed.

Ultimately these two perks are what drew NASA as to selecting Florida as the top destination of choice.

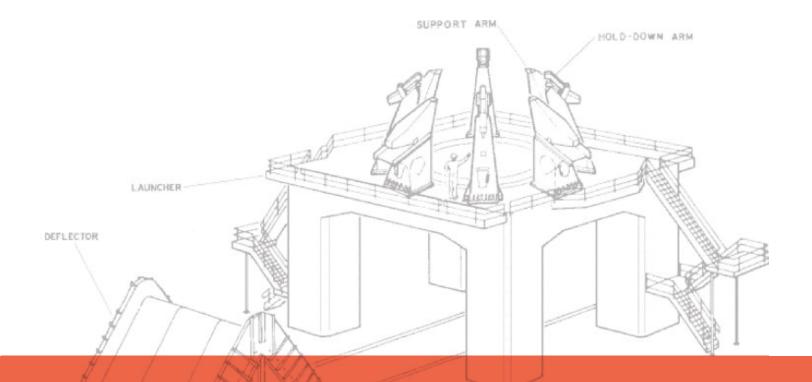

This diagram shows the relationship of the site with its urban context. It is located roughly 50 miles away from Orlando, Florida. It is somewhat

isolated from the "natural" public since it is located on a military base. The public transportation system from KSC will be used for main access

The concept of time as past, present, and future "residing and occupying" the in the same "space" in terms of architecture widely occur within the compound of Kennedy Space Center in Cape Canaveral, Florida.

Here past, present and future resides and interacts with each other daily. However, gone are the bustling golden days of the modern "space race" in which time interaction once thrived within the present day sense.

The facilities and sites that once were booming and vital to the lunar space program in the United States now lay abandoned earning honorable badges of weathering and decay throughout the United States. Each site has its own unique role in successfully landing American men on the moon but one site particularly stands apart from the rest. Launch Complex 34 is one of these complexes that ultimately need architecture interposition to the connection between past, present, and future generations.

This modern "ruin" demands an architectural intervention to revitalize the abandoned site with memories of the past, the life of today, and visions of the future.

### SATURNIB AS-204 MISSION TYPE

**Crewed spacecraft** 

Verification test

**OPERATOR:** 

NASA

**MISSION DURATION:** 

Up to 14 days (planned)

**SPACE CRAFT:** 

**CSM-012** 

SPACE CRAFT TYPE:

Apollo Command/

**Service Module** 

MANUFACTURER:

North American Aviation

LAUNCH MASS:

45,000 lbs

**MEMBERS:** 

Virgil I. "Gus" Grissom

**Ed White** 

**Roger B. Chaffee** 

LAUNCH DATE:

February 21, 1967

**ROCKET TYPE:** 

**Rocket Saturn IB AS-204** 

LAUNCH SITE:

Cape Kennedy LC-34

END OF MISSION:

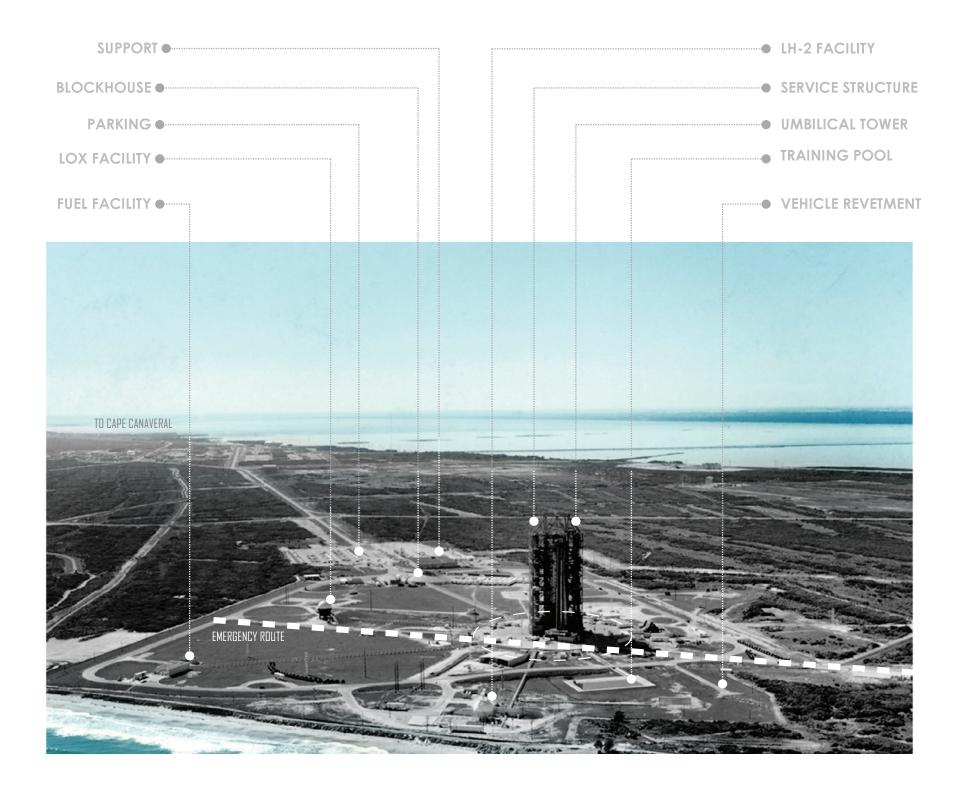

Destroyed

January 27, 196

**APOLLO 01** FACTUAL INFORMATION

Three

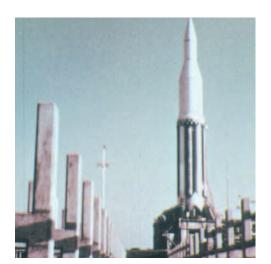

This diagram shows Launch Pad 34 and all of the utilities that made up the site when it was active. This site was once thriving and active trying to successfully land Americans on the moon. As you can see, the site is quite large and spacious allowing maximum area to launch rockets as well as testing facilities that contributed to advancement of the space program. The images on the opposite page are all taken from Launch Complex 34. They show what the complex once looked like when it was in use. It is now overgrown with vegetation and in need of an architectural intervention to revitalize the site to accommodate for future space tourism.

## **ARTIFACTS** SCARS OF THE PAST

The image above is of the "base". The base is still located within the middle of the launch pad. This base is made of solid concrete and becomes the largest artifact enclosed in the museum. The base also has a memorial plaque commemorating the tragedy of the Apollo One mission and the loss of the three astronauts' lives.

The image above is of the "tracks" that carve through the concrete pad. These tracks once held the umbilical tower that used to service the Apollo rocket. These tracks become "vertical planes" that cut through a "prism" of "skin" that occupy the site. They are left untouched allowing a visitor to visualize the past.

The image above is of the blast shields that moved into place underneath the base when the rocket was ready to launch. These shields would move into place during the time of day in which the tragedy of the launch took place. They would act as symbols of time as they moved on along the surface of the pad.

## SITE DESIGN HOW THE SITE & BUILDING WERE SHAPED

The overall site design of the project is highly influenced by the urban context surrounding it and the program of the space program that is once hosted.

Launch Pad 34 is already a designed project pertaining to the Apollo missions. However this development is highly weathered and suffers from overgrowth of vegetation. This then called for the site to be planned for a series of phased developments. The overall master plan of the site is developed based on a series of axis that extend from the center of the Launch Pad and reach out to the centers of urban development around it. These developments ate shown in the graphics on the next page.

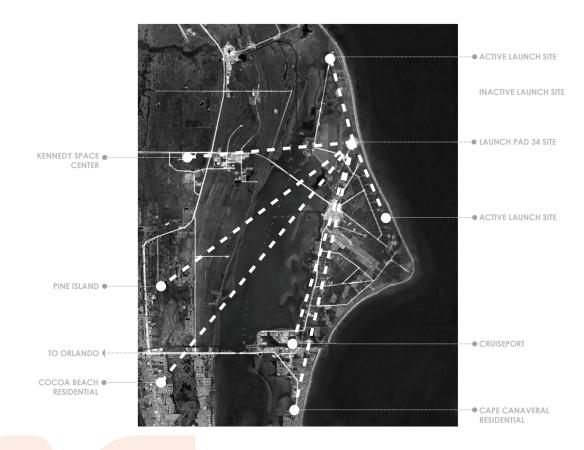

There are many potential areas of architectural intervention in which these lines of axis have created and have shaped the site to host not only the museum, but potential developments of research centers, parks, and viewing plazas for future NASA and SpaceX launches..

This diagram shows the relationship of the site with its urban context. It is located roughly 50 miles away from Orlando, Florida. It is somewhat isolated from the "natural" public since it is located on a military base. The public transportation system from KSC will be used for main access

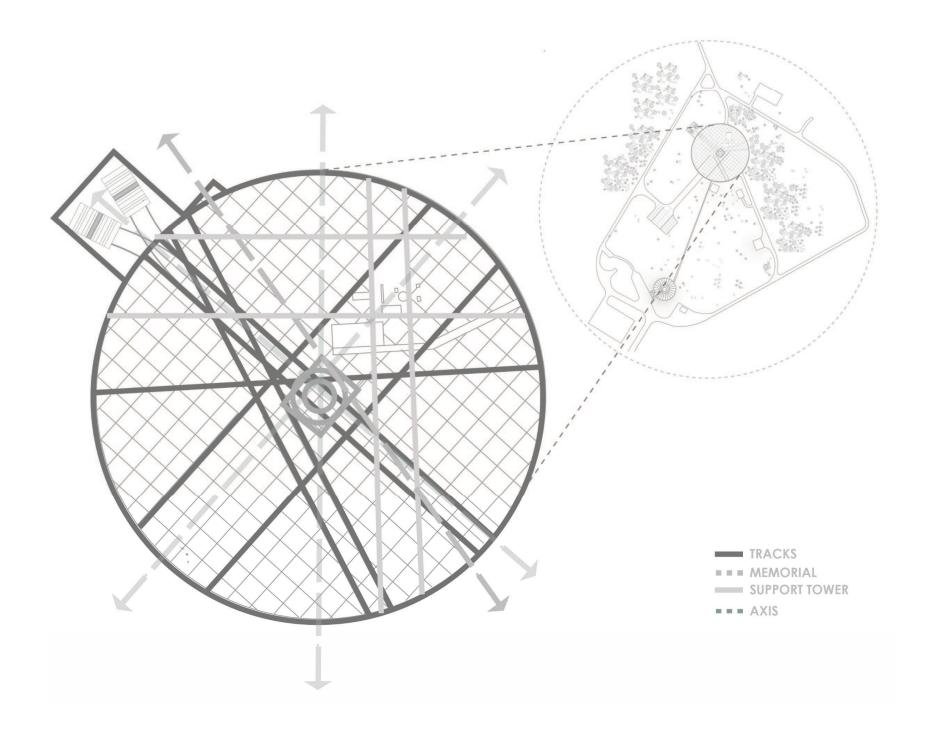

This diagram is showing the safety radiuses of the launch facilities that surround the site. The site is nestled perfectly within the radiuses and as space tourism and commercialization continue to grow, this location would allow optimum viewing of the future launches by NASA and SpaceX that would take place at the active launch pads that flank the site.

This diagram is showing lines of axis from the populated areas surrounding the site. These selected areas of interest are what shaped the master plan of the site itself. The center of the mater plan hosts the main project and the main project would have a large projection of light that would act as a beacon urging residents and tourists to visit the site.

This diagram shows the Launch Pad 34 concrete slab itself. The slab is broken into 20ft by 20ft squares of concrete composing the circle base with the central concrete base that held the rocket into place for the Apollo mission series. The diagram also shows the relationship of where the tracks, the support tower, and the small memorial to the concrete base. These tracks and elements of the base ultimately become the "planes

of the past". The planes then contributed to the overall formation of the building and remembrance of what occurred many years ago in the past.

## JOURNEY INTO THE FUTURE OF SPACE EXPLORATION

\*

The memorial space museum and planetarium, or Astraterno embodies a journey exploring the fluidity of time through architecture. The building takes on its footprint by acknowledging historic axis of the past. Whether the axis are clearly marked within the site, such as the tracks in which allowed tectonic movement of the rocket and scaffolding that once were present, or implied such as a visual plane stemming from small memorial slightly off site, these axis become defined "planes of the past". The planes then emerge from the site and become the footprint of the building and allow it to take on its form. The overall form of the building if broken into four sections of program: museum, planetarium, education, and administration. These sections of program are derived from the different "stages" of the once grand rocket that resided on the launch pad. Their heights vary with program but the overall height of the building stops at the first level of the maintenance arm of the umbilical tower that once held the rocket into place. The building also takes on its form by respecting the notions of the past, organization of time by levels, and the architectural promenade aims to break though planes of the past and present to express time as being relevant.

## 0 1

The first floor of the building occupies the past of the concrete launch pad. This floor has the entrance to the museum as well as entry to a two story gift shop. There is access to a cafe, viewing plazas, and a records room.

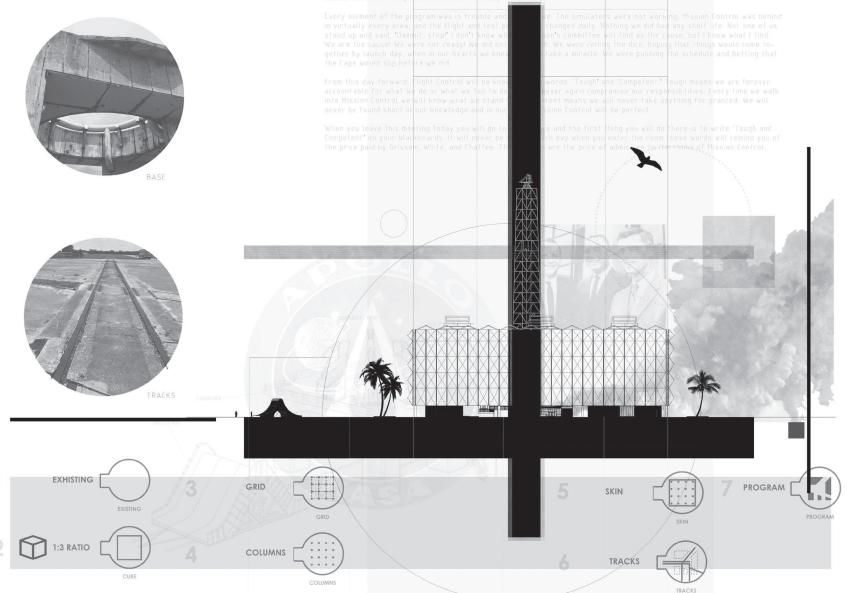

There is a reflection room for those who wish to pay their respects to the astronauts who perished many years ago.

This floor also has access to the concrete base and blast shields. The blast shields will move into place along the tracks that have formed the building around it during the time of launch.

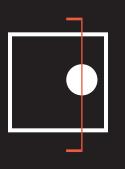

Spaceflight will never thierate careless ess, incapacity, and neglect. Somewhere, somehow, we screwed up. It could have been in design, build, or test. Whatever it was, we should have caught it. We were too gung to about the schedule and we locked out all of the orbblems we saw each day in our work.

This diagram shows the parti of the building. It shows the existing artifacts and the movements that were chosen to make the form of the overall building on the bottom section of the image. This diagram is later repeated in the movement section of this book. The movements are diagramed in plan. The vertical piece of this diagram represents the umbilical tower. The tower in which supported the rocket. This tower is no longer on the site but is remembered with a special program and tour access. The diagram is abstract but it relates to the past, present, and future and how the building becomes a whole entity, the **ASTRATERNO**.

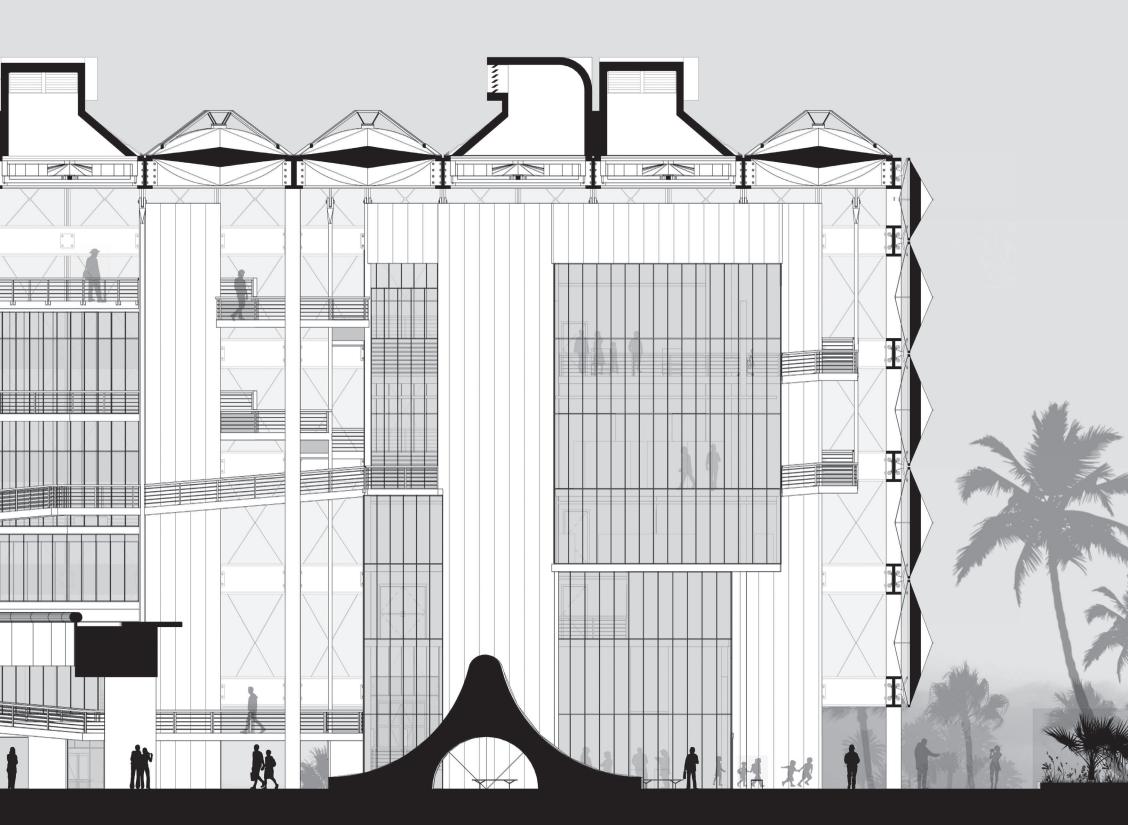

The second floor of the building is representative of the fast. Here there is where the visitors begin their journey. This floor hosts the first theater that has a constant showing of a memorial show of the three lost astronauts. This floor has office spaces that are private to the museum. There is also access to a second story gift shop.

and research is symbolic of the future, since education and advancement of technology and knowledge is the legacy of what the Apollo missions and the missions that followed represented.

of museum programed toward the future. This level also has a open sky deck and access to an ending gift shop and elevators to end the journey that took the user through time.

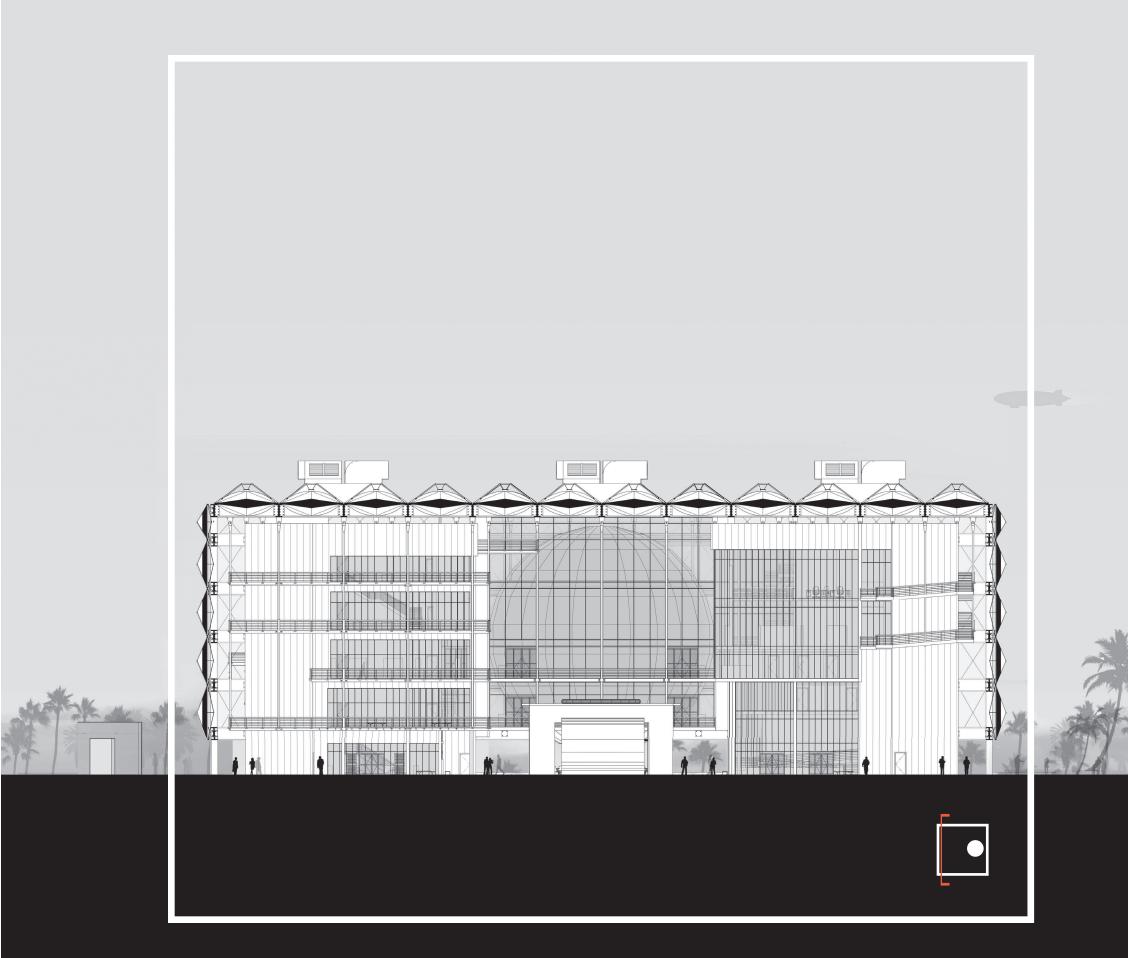

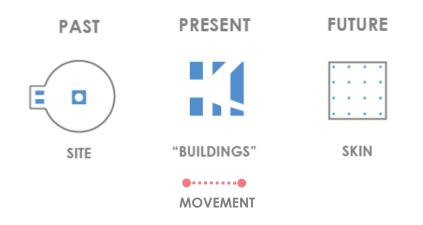

event space that could be used for museum events or events for the research and education branches of the museum. This floor is unique in that is hangs from the super structure prism that encases the whole building.

The building challenges the idea of making massive objects that were used for the purpose of launching rockets to the moon to a more human-friendly scale. The artifacts on site (roughly two stories in height) become less dominate when placed next to the planetarium and the large super structured roof of ETFE bubble panels with large exhaust fans. These large objects in relationship to one another then make the once dominating site objects seem more in context with a newly programed architectural intervention.

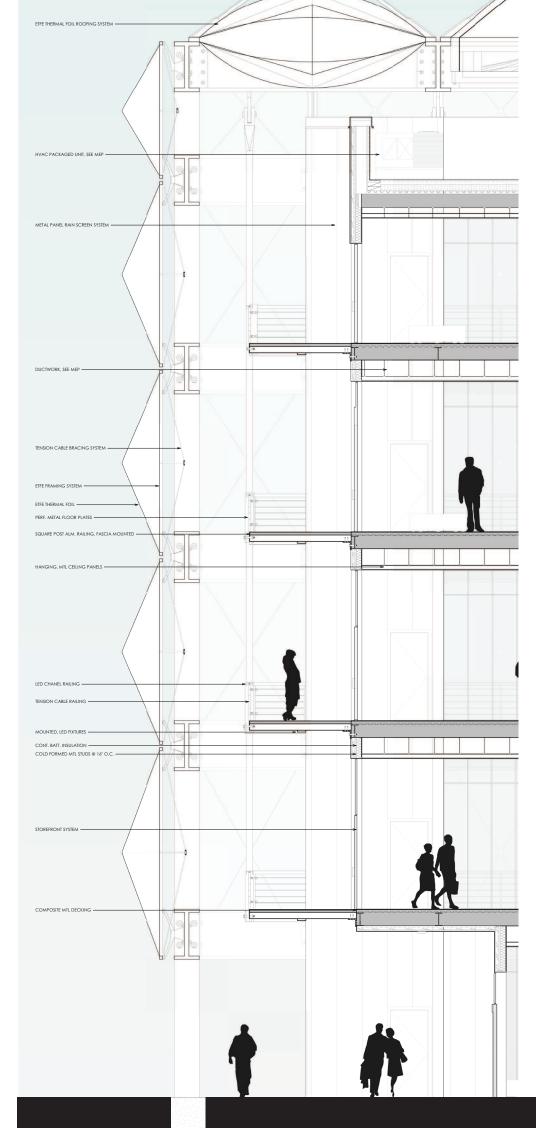

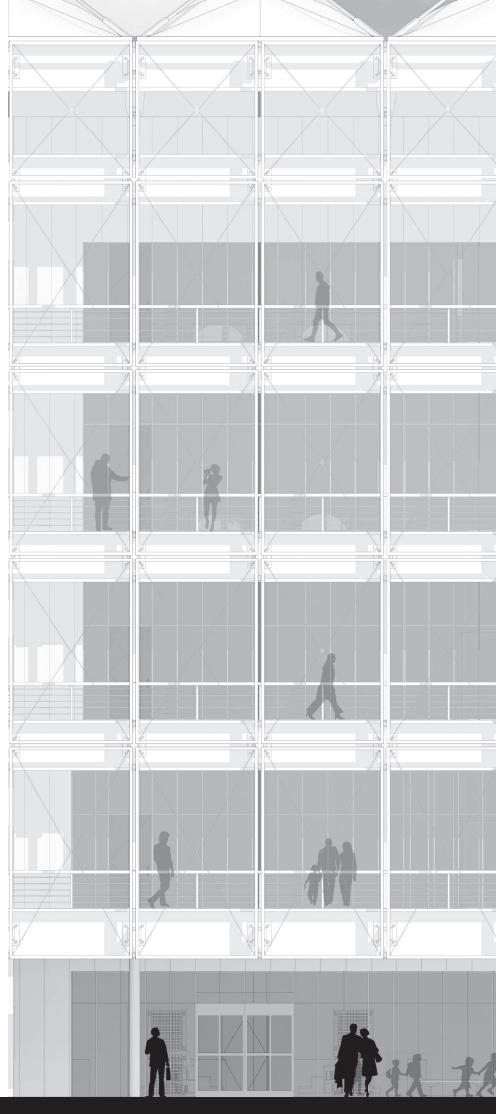

Astraterno occupies the "ancient ruin" of the circular base on Launch Complex 34 in Cape Canaveral, Florida. The building's super structure prism that is placed directed in the center is 270 feet long by 270 feet wide by 80 feet tall. This prism follows a 1:3 ratio respecting the three astronauts that lost their lives on that fateful day. The prism is made up of a futuristic material, Ethylene tetrafluoroethylene, or ETFE. This material allows protection of the majority of the existing "ruins" of the site as well as projection for the internal buildings within while allow natural light to pass through. Since the area of the super prism is so large, the roofing system of the ETFE is embedded with photovoltaic receptors, or PVs, within the air inflated "pillows" and then acts as a light harvester translating into energy for not only the buildings it protects, but for the entire site. The skin of this superstructure also has a different application of the ETFE material. The skin stretches from the height of the roof (eighty feet) down to fifteen feet above the existing base of the complex. From a distance the "prism" will appear to be floating, acting as a threshold between past (the base), present (the internal buildings), and future (the skin).

Internally, the "buildings" within the super structure are defined by "scars" of the past, being the tracks and movements that have shown with time. The buildings are then linked together via a series of intricate ramps that lead the occupants along a "time line" of the museum, the architectural promenade. The ramps are composed of perforated metal sheets that act as a semi-transparent layer between the transparent skin, and the more solid forms of the buildings. This path provides areas of viewing to the "ruins" of the past and destinations of exhibits. The user experiences different sensations of height between the buildings, and ultimately ends up in gallery spaces that are fifteen feet in height.

Along with the ruins and galleries, the building contains a massive piece that intersects all three elements of time: the planetarium. The planetarium houses two theaters. The first theater is located within the past section of the museum. It can hold around 50 standing guests at a time to view a short film on the tragedy that took place on the site. The second theater is the seated 150-occupant theater in which multiple films can be shown on what is happening in the present and future of space exploration. The planetarium is encased in curtain wall systems and can be seen from all areas internally as well as being approached from the main entrance. The building also houses areas of office and education, as well as a cantilevered viewing platform that special tour groups may visit and looks out into the center of the site, down into the concrete base.

Future launches that take place are also an important quality that makes the Asteraterno so unique. The location of the building allows visitors to come tour the museum during regular days, but on launch days from patrons like SpaceX and NASA host, the building turns into a celebratory event that can host viewing parties to the east and west of the building, as active launch pads outside of the safety radius can be seen from both directions. The master plan of the abandoned site also allows for multiple future expansions. The site could generate multiple facilities for research for the current privatization of space exploration for companies such as SpaceX. The facility could also house collaborative spaces in which researchers, artists and architects could interact and explore ideas about future space travel. Along with the facilities, the proposed master plan incorporates planned trails as interactive nature links for the buildings to use as well as other occupants to the site. These proposed future developments, along with Asteraterno, would act as urban catalysts to the site and the future development of the entire region as the privatization of space exploration increases as time marches on.

The building focuses on the idea of time acting as an architectural promenade breaking through "planes" (or "frames of time") created by the multiple buildings within the super structure "prism". These planes are implied through space and materials surrounding path, which will invoke the "subconscious progression of time" an individual may have.

Individuals also experience the effects of time in a direct and unique relationship between architecture and human scale. Scale acts as a significant marker of time and also as an experience of passing throughout time. Gallery spaces of the museum expressed themselves in greater height, marking a significant time event.

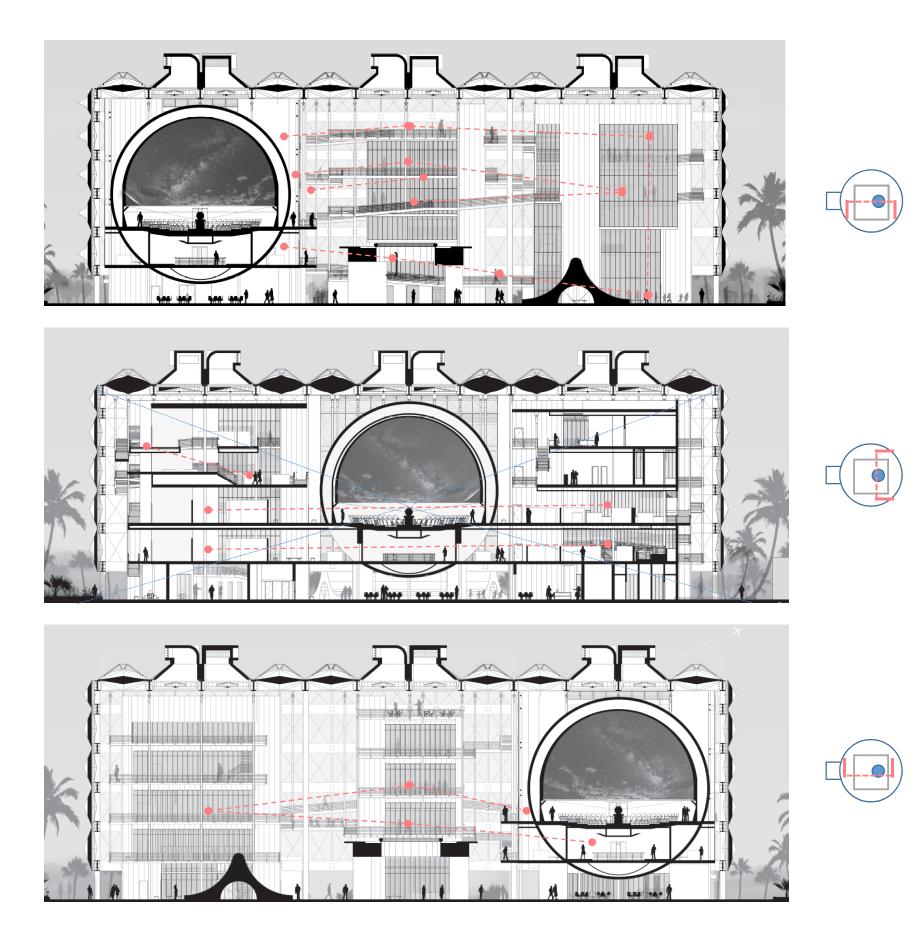

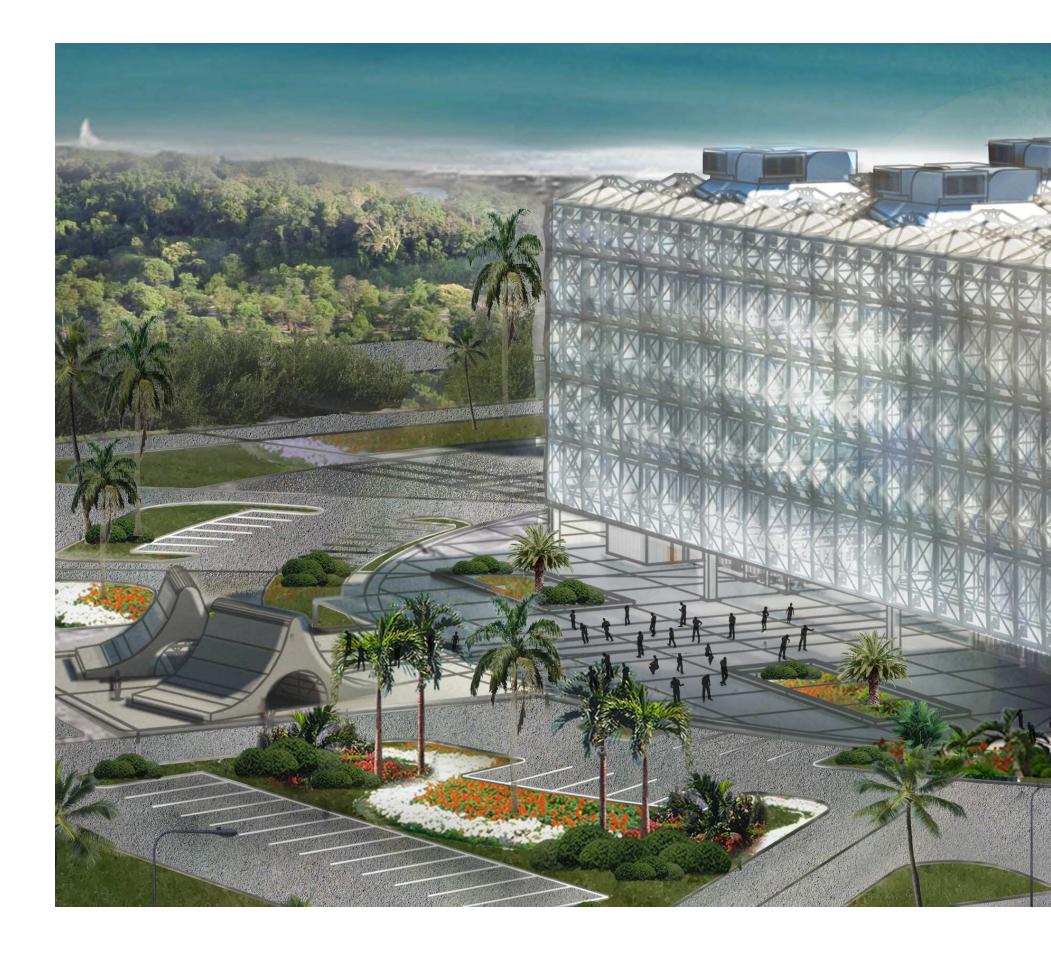

The path an individual may take throughout the building will respect and acknowledge the implied record of the prior events that played a major role in defining a time period but by also creating a newly defined record unique to the present day architecture in which it resides. Along with respecting the existing events and defining new, the paths will then challenge the presence in which one experiences time by revealing the layers of the past in materiality. This reveal defines past and recognizes it within the present, and as one proceeds, the future becomes more evident.

Christopher Bollas once expressed this idea of portraying future in his writing "Architecture and the Unconscious". "Although they (architectural works) will outlive us, they will nonetheless signify us in the future, giving us a place of historical time, and the existential reality of future generations who, upon gazing at these objects may think of the later twentieth century: our time of life." The building itself challenges and explore time and its relationship to architecture by investigating as to what elements can make a building not only stand against time, but navigate it as well

Astraterno is piece of architecture that acts as an embodiment of time. It expresses the fluidity of past, present, and future coming together into one cohesive structure. The building allows occupants to experience time in a matter beyond the typical understanding of time.
