3. Strategies
4. Case Study
5. Conclusion

Background

1. Background
2. Challenges
3. Strategies
4. Case Study
5. Conclusion

The Scholarly Web

- ▶ Information continues to migrate to the web
- ▶ Scholarly material is increasingly found on the web
- ▶ Lines between “digital libraries” and websites often blurred

Change

- ▶ Web content is ephemeral
- ▶ Web standards have high volatility

Preservation

- ▶ Stable methods of preservation of web content
- ▶ Available but inaccessible: *de facto* data loss

Challenges

1. Background
2. Challenges
3. Strategies
4. Case Study
5. Conclusion

Evolving Standards

- ▶ HTML: 5 different standards in 10 years
- ▶ Shift from SGML to XML
- ▶ Increasing separation of semantics and presentation

Lenient Validation

- ▶ Since MOSAIC, browsers have been lax
- ▶ “Standards” and “quirks” modes
- ▶ Not tenable in the long-term

Inconsistent Structure

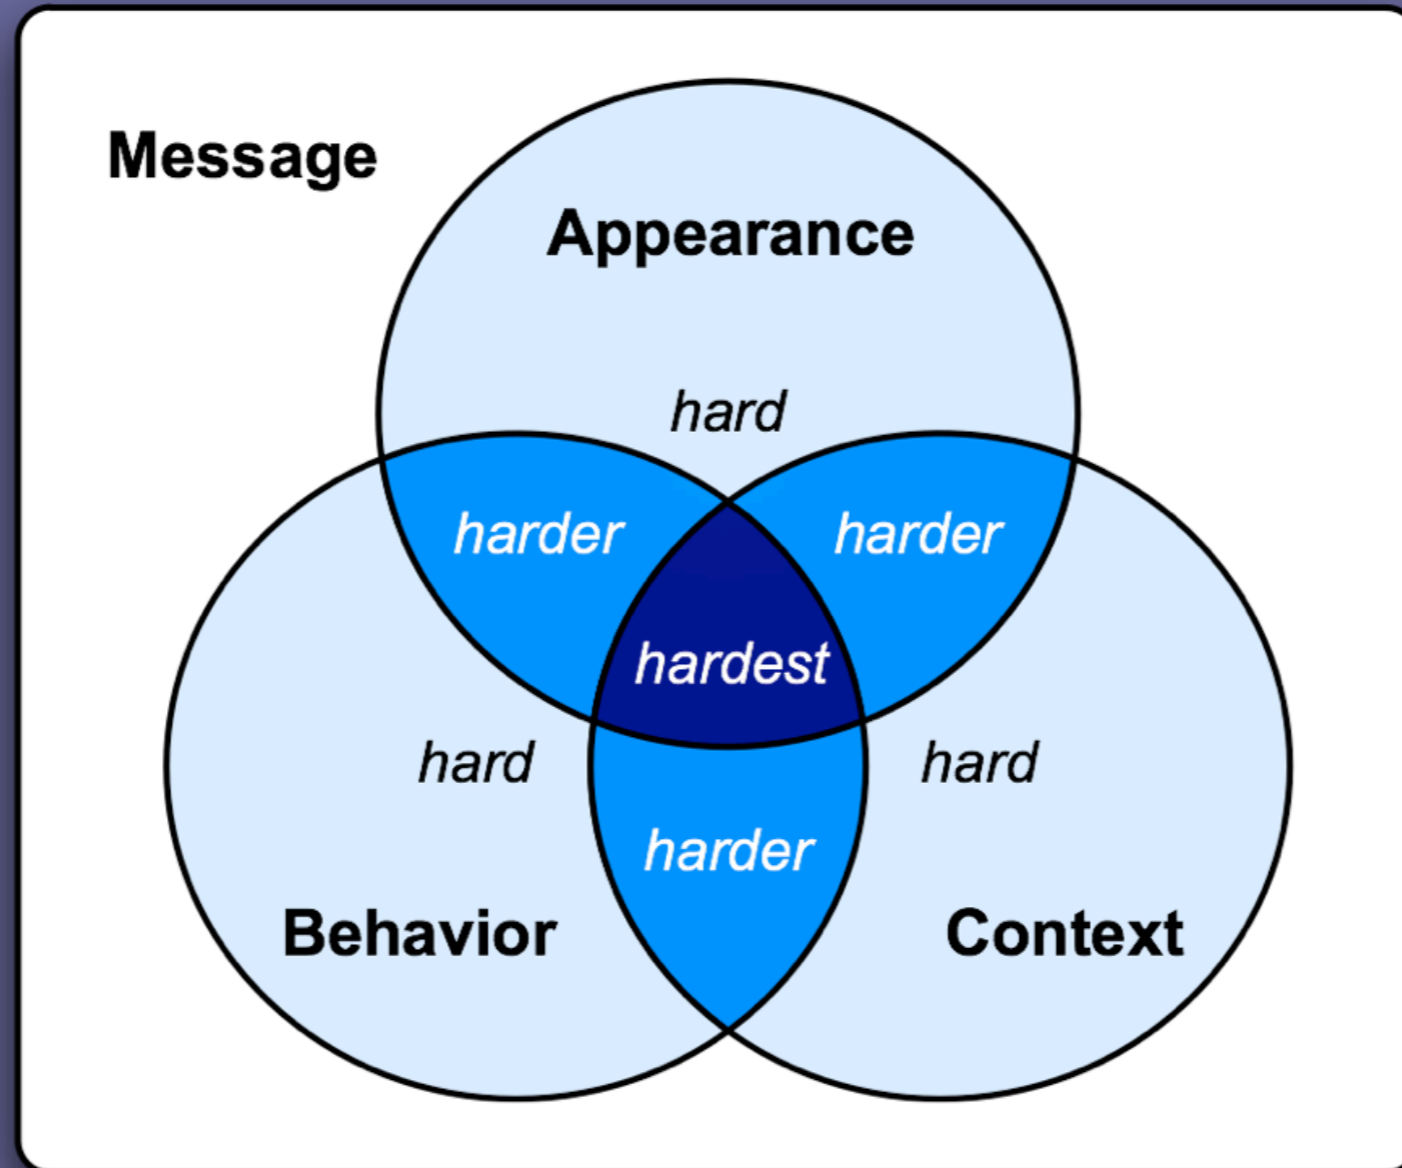

- ▶ Multiple authors, changing schema
- ▶ Ambiguous nomenclature

Message Preservation

- ▶ Inherent difficulties with definitions
- ▶ Document: physical manifestation of a message
- ▶ Levy: “bits of the material world... that we have imbued with the ability to speak”

3 Aspects of Document

- ▶ Appearance
- ▶ Behavior
- ▶ Context

3 Aspects of a Document

Author Intent

- ▶ Intersects with all 3 aspects
- ▶ Judging intent is frequently subjective
- ▶ Determined by others when author unavailable

Appearance

- ▶ For scholarly works, usually not as important
- ▶ Semantics/presentation separation clouds intent

Behavior

- ▶ Particularly important in digital environment
- ▶ Evolving web ecosystem shifts meaning of encodings
- ▶ Intrinsic message component or ubiquitous mechanism?

Context

- ▶ Both reader's background and context at time of reading
- ▶ Focus on issues unique to the web: link networks
- ▶ Resilience to change in location and reference

Strategies

1. Background
2. Challenges
3. Strategies
4. Case Study
5. Conclusion

2 Strategies

- ▶ Emulation
- ▶ Migration

Emulation

- ▶ Document preserved as originally authored
- ▶ Interpreter emulates all original system functionality
- ▶ Interesting technical problem; frequently addressed

Emulation: Permutations

- ▶ Multiple standards, multiple interpretations
- ▶ Incompatible web ecosystems; each with separate interpreter
- ▶ Undocumented; originally intended ecosystem unknown

Emulation: Interpreter

- ▶ Sheer number of permutations very large
- ▶ Interpreter = browser
- ▶ Unreasonable to assume all permutations will be maintained

Emulation: Links

- ▶ For web content, link context is key
- ▶ Link semantics may evolve to create incompatibilities
- ▶ Technical and geo-political considerations

Emulation: Responsibility

- ▶ Preservation burden shifted to end user
- ▶ Better handled by trained archivists
- ▶ Hypertext archivists

Migration

- ▶ Documents periodically translated from older formats
- ▶ Access occurs with current tools
- ▶ Requires continual maintenance

Automatic Migration

- ▶ For large scale migration efforts, more cost efficient
- ▶ Predictability is high; results are consistent
- ▶ Potential exists for reuse

Automatic Migration

- ▶ Automatic methods unable to understand the *message*
- ▶ No consideration of author intent
- ▶ Necessary pre-conditions; data consistency

Manual Migration

- ▶ Significant human intervention during process
- ▶ Potential for inconsistency and transcription error
- ▶ Higher cost per document; not tenable on large collections

Manual Migration

- ▶ Greater flexibility with inconsistent data, lenient validation
- ▶ Able to interpret author intent
- ▶ Understanding of document *message*

Link Migration

- ▶ Methods of preservation depend on degree of control
- ▶ 2 link components: pointer and target
- ▶ 3 link types: *internal, in-coming, out-going*

Internal Links

- ▶ Both pointer and target under control of same archivist
- ▶ Preservation through simultaneous change to both components
- ▶ Change in target location triggers modification to all associated pointers

In-coming Links

- ▶ Target under control of the archivist, but pointer is not
- ▶ To preserve the validity of the link, original target location must be maintained
- ▶ Transient location mechanisms add layer of indirection

Out-going Links

- ▶ Pointer under control of the archivist, but target resource is not
- ▶ Target likely to change or disappear
- ▶ Point to original location anyway; point to an archived copy

Case Study

1. Background
2. Challenges
3. Strategies
4. Case Study
5. Conclusion

Journal of Digital Information

- ▶ Peer-reviewed, electronic-only journal
- ▶ First published in 1997
- ▶ Older, non-standard technologies

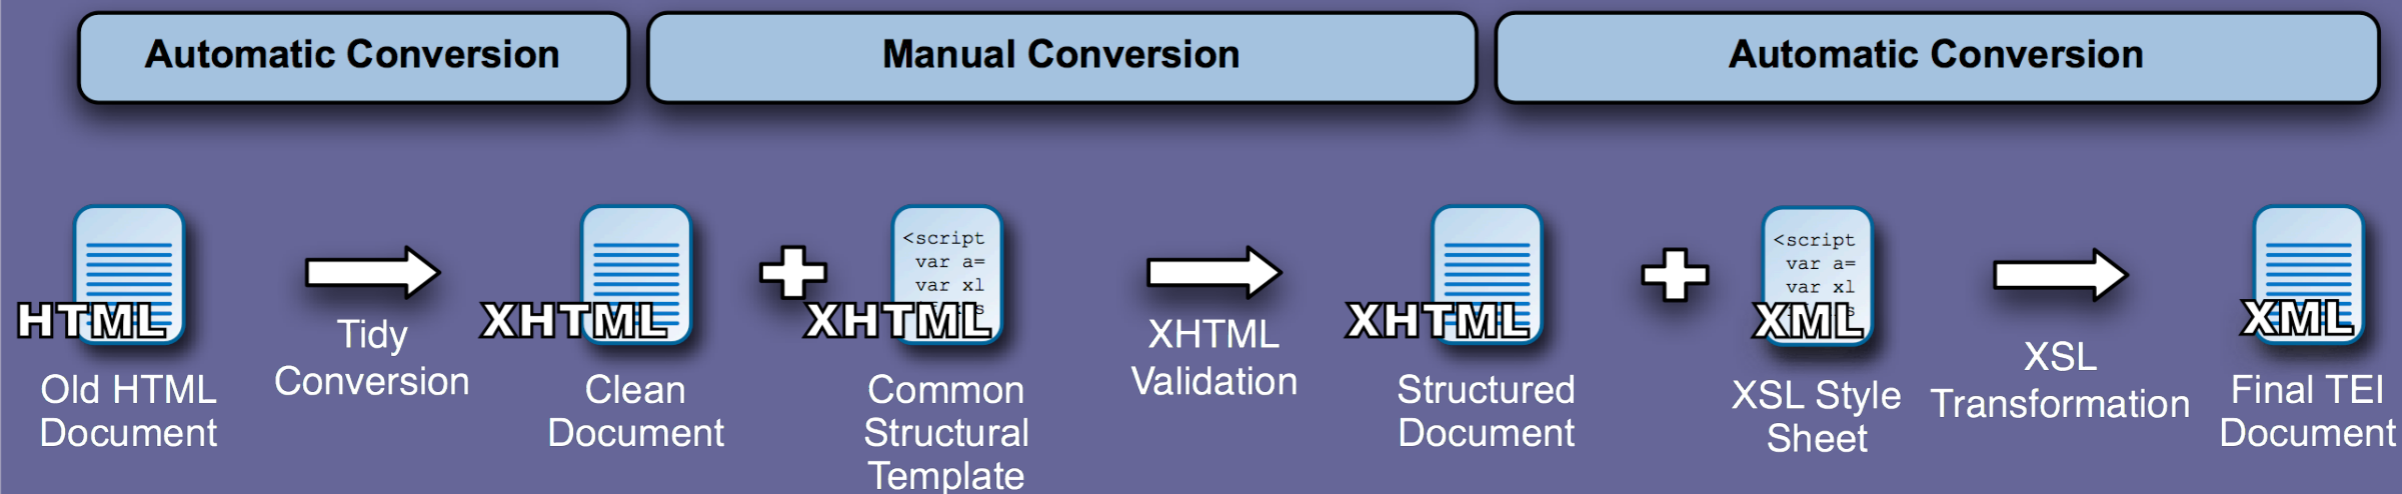

Goals

- ▶ Immediate: upgrade to OJS
- ▶ Short-term: improved services
- ▶ Long-term: stable preservation format

Automatic Conversion

- ▶ Inconsistent structure
- ▶ Evolving standards
- ▶ Message preservation (back to author intent)

- ▶ Multi-stage process
- ▶ Manual stage allowed decision on intent
- ▶ Message preservation, translation

Link Migration

- ▶ Internal: manual change to pointer, target
- ▶ In-coming: two-phased solution; preserve targets, redirects
- ▶ Out-going: left as originally authored; context issues

Conclusion

1. Background
2. Challenges
3. Strategies
4. Case Study
5. Conclusion

Lessons Learned

- ▶ Automation useful and necessary
- ▶ Significant issues create difficulties:
structural inconsistency, author intent
- ▶ Issues should be addressed at document creation

Future Work

- ▶ Creation of conventions for document structure
- ▶ Deprecation of “quirks” mode
- ▶ Better automation tools
- ▶ Recognition of new role: the hypertext archivist

Call to Arms

- ▶ Issue needs attention from digital preservation community
- ▶ Web is full of documents in nearly obsolete formats
- ▶ Effort now to preserve this portion of the scholarly record
- ▶ Effort directed at mechanisms to prevent perpetuating cycle
