China: ranking 2\textsuperscript{nd} in the world of primary energy consumption in 2006
Per capita primary energy consumption in 2006 (toe)
According to the World Bank: Two “Half's”

- By 2015 the World Bank predicts that half of the world’s new building construction will take place in China.
- The World Bank estimates that more than one-half of China’s urban residential and commercial building stock in 2015 will likely be constructed after the year 2000.
- A vast majority of these projects are very large, such as commercial office buildings between 1 to 1.5 million ft\(^2\) and residential developments involving 5 million ft\(^2\) of construction area.
Comparison of heating and cooling demand

Lower energy consuming level in residential buildings

By surveying among ten thousand households of Shanghai in 2004, average annual primary energy consumption per household is only 973kgce (13.7 kgce/m2a), about one third to one fourth of mean level of US households (3320kgce) in 2001.
Lower energy consuming level in residential buildings

In 2004, average electricity usage per household in Shanghai is lower than average electricity usage per household of US for cooling, about one fifth of annual electricity consumption per household in US in 2001.
Comparing of energy consumption for heating in residential buildings (kWh/ m² HDD)

Beijing 0.0811
Harbin 0.0421
Changchun 0.045
Anshan 0.0835
Tangshan 0.0515
Taiyuan 0.0484
Lanzhou 0.0475
Baotou 0.0483
Germany 0.0477

The people's livelihood problems

- Average annual energy charge paying for Shanghai’s households is accounted for 26% of per capita disposable income in lower-income families.
- The room temperature in most households of Shanghai is lower than 14 °C in winter, due to poor insulation and intermittent operating of heat pump.
- Most households have turned on their RAC in summer only when the room temperature was higher than 29 °C. We can learn from surveying data over 80% of housing rooms are out of ASHRAE comfort criteria zone.
- Most households have to suffer indoor humid surroundings higher than 70% during raining season in every June.
- In aged society (the proportion of the aged population in Shanghai is over 20.8% in 2007), non energy consumed measurers are helpless for IEQ improvement.
Comparing with the office building in Japan

- Changsha: 1.673 GJ/m²a
- Wuhan: 1.446 GJ/m²a
- Tianjin: 2.2 GJ/m²a
- Shanghai: 1.598 GJ/m²a
- Beijing: 2.193 GJ/m²a
- Hangzhou: 1.553 GJ/m²a
- Chongqing: 1.477 GJ/m²a
- Guangzhou: 1.042 GJ/m²a
- Shenzhen: 1.165 GJ/m²a
- Taiwan: 1.821 GJ/m²a
- Japan: 1.804 GJ/m²a
Limitation of technologies due to weather diversity

- Natural ventilation
- Solar energy (photovoltaic)
- Daylighting
- Ground source heat pump
Shanghai: energy expenditure prospects of residential buildings by scenario analysis ($10^4$ tce)

**SA**: normal polices; **SB**: mild polices; **SC**: strict polices

Comfort hours with natural ventilation (source: MIT)

Comfort Zones for Developing Countries (B. Givoni)

NV is not suitable for most times in Shanghai

- Introduce humid air for growth of mildew and microbe;
- Introduce air polluted by traffic exhaust in downtown;
- Security problems with opening widows in the night;
- Disturbing of strong air flow to dense high-rise buildings in downtown of the metropolises;
- The indoor air flow pattern is not so good organized and designed.
Photovoltaic: an expensive technology for demo

- Duration of equivalent full-load bright sunshine is only 980 hours in Shanghai;
- The cost of photovoltaic is 70,000RMB/kW;
- Electric tariff is about 1RMB/kWh for commercial buildings;
- Pay back period would be 70 years;
- No any benefits for normal investors;
- There are no policies for connecting to outer grid and purchasing (except to projects developed by utilities themselves)
Transparent roof with poor indoor thermal environment

- Transparent roof and/or vault would be with good daylighting but oppressive hot environment in summer.
- In atrium and dome there should be hybrid ventilation and underfloor air supply system.
Ground source heat pump: the heating and cooling load should be carefully balanced

- In Shanghai the cooling load is far higher than heating load.
- The temperature of soil would raise after several years of the heat pump operating.
- It is better to determine the size of GSHP according by heating load.
- To supplement in summer by normal chiller with higher efficiency (like centrifugal chiller).

The contribution rate for GHG emission
Appalling news

- IEA World Energy Outlook 2007: *China is by far the biggest contributor to incremental emissions (of CO2), overtaking the United States as the world’s biggest emitter in 2007.*

- The Netherlands Environmental Assessment Agency (MNP): *With approximately 8% higher emissions than those of the USA, China now tops the list of CO2 emitting countries.*

- By Maximilian Auffhammera and Richard T. Carson from University of California, San Diego, USA: *The size of the increase in emissions of China till 2010 in sharp perspective, it is significantly larger than the decrease in emissions embodied in the Kyoto protocol.*
Climate change of China’s mainland during the past 54 years
Documents and Statements

- China National Plan for Coping with Climate Change;
- National Assessment Report on Climate Change;
- "We should ensure that both production and consumption are compatible with sustainable development. We should optimize the energy structure, promote industrial upgrading, develop low-carbon economy, build a resources-conserving and environment-friendly society and thus address the root cause of climate change," said the Chinese president Hu at APEC meeting 2007.
Projects

- Energy system in Shanghai 2010 Expo Park
- Low carbon economy demonstration zone in Chongming Island
- Guide for low carbon community energy planning
- Collaborative projects with Siemens
River water source distribution system for heat pump

Huangpu River

EXPO Axis

EXPO Center
Impact of condensing water outlet to the river
Shanghai EXPO Axis and EXPO Center
Low carbon demonstration zone: Chongming Island
The project

- Title: *Research on industry developing, application of know-how integrated technologies and demonstration in Chongming low-carbon economy demonstration zone*
- From Ministry of Science & Technology (MST)
- Would be one of the national major key projects
- Duration would be 3 years (till 2011)
- Budget would be several decades million RMB
- Should give demonstrations
- Tongji would be major or exclusive institution to undertake and implement the project
- Status:
  - The feasibility analysis report has been finished;
  - The project will be decided before end of this year.
Project structure and contents

Low carbon economy

Demonstration in Chongming Island
Subprojects: Energy

- Methodology of IRP (Integrated Resources Planning) using in community energy planning for low-carbon park in Chongming Island.
- Community-oriented system technologies integrating renewable energy & unused energy.
- Demonstration of integrated energy system (trigeneration) based on biomass energy.
Principal of community energy planning: Energy efficiency as a resource

Collaborative project with SIEMENS: Qingdao ecological community

- Siemens/Tongji/Government of Qingdao/ARUP
- 3.5 hectares
- 60,000 m² floor space residential
- 6,000 m² floor space commercial
- Self-sufficient
- Zero-waste
Low carbon technologies: should be studied

- Temperature difference: solar collector vs. thermal cooling
- Concentrated usage mode of low exergy & renewable energy
- Micro grid for distributed & multipoint energy sources
- DCHP (district cooling/heating/power): load matching & system optimization
- DCW (distributed condensing water) or Energy Bus system
- Baseline of CO2 emission from buildings
